BEFORE THE DIVISION OF OIL, GAS AND MINING  
DEPARTMENT OF NATURAL RESOURCES  
STATE OF UTAH

---

In the Matter of the	)	TRANSCRIPT OF
Permit Renewal for the	)	INFORMAL HEARING
Co-Op Mining Company's	)	
Bear Canyon Mine, Emery	)	
County, Utah.	)	Cause No. Act/015/025

---

BE IT REMEMBERED that the above-entitled matter came on for informal hearing before the Division of Oil, Gas and Mining on Tuesday, February 5, 1991, at 6:30 p.m., at the Emery County Courthouse, Second Floor, 95 East Main, Castle Dale, Utah. The informal hearing conducted by Dianne R. Nielson, Director, Division of Oil Gas and Mining, and was reported by John F. Greenig, Registered Professional Reporter and Notary Public in and for the State of Utah.

Notice was given to the State of Utah and all parties interested in the above-entitled matter.

APPEARANCES

Division of Oil, Gas	Dianne R. Nielson, Director
and Mining	Pamela Grubaugh-Littig, Permit Supervisor
	Thomas A. Mitchell, Assistant Attorney General
	Thomas Munson, Reclamation Hydrologist
	Vicky Bailey, Secretary

## PROCEEDINGS

MS. NIELSON: I realize there are still a few people coming in, but I would like to get this started. I'm Dianne Nielson. I'm Director of the State Division of Oil, Gas and Mining for the State of Utah. The hearing this evening is an informal hearing -- an informal Division hearing. And it's being conducted with regard to the matter of the renewal of the coal mining permit for the Bear Canyon Mine in Emery County.

As part of the hearing tonight, the proceedings will be reported. And I'll provide information in just a minute as to how you might obtain information regarding the hearing.

For the record, I'm going to read in the Notice that was published on this hearing. "In the matter of the permit renewal for the Co-Op Mining Company's Bear Canyon Mine, Emery County, Utah; Notice of Informal Division Hearing. The Cause Number: ACT/015/025. The Notice is hereby given and found to be sufficient that the Division of Oil, Gas and Mining will conduct an informal hearing on Tuesday, February 5, 1991, commencing at 6:30 p.m. at the Emery County Courthouse, Second Floor, 95 East Main, Castle Dale, Utah. "The informal hearing will be conducted in accordance with Utah Code Annotated, Section

1 40-10-13 (1953 as amended) and Utah Administrative Code  
2 Rules R614-300-122 and 123 (1990).  
3

4 "The permittee, Co-Op Mining Company, is currently  
5 operating the Bear Canyon Mine, an underground coal mine  
6 in Emery County, Utah. Permittee has applied for renewal  
7 of the permit and also revision of the permit to include  
8 additional land for mining. Objections including, but not  
9 limited to, issues of water rights and impact of mining  
10 on the quality and quantity of Big Bear Canyon Spring,  
11 Birch Springs, and related surface and subsurface hydro-  
12 logy have been raised during the public comment period."

13 This hearing provides an opportunity for the enti-  
14 ties that have raised objections during that public com-  
15 ment period to state their case, and it also provides an  
16 opportunity, as time is available, for other individuals  
17 hearing this evening to make comments.

18 The three objectors at this -- to the Permit are  
19 Castle Valley Special Service District in Castle Dale,  
20 Utah; North Emery Water Users Association in Elmo, Utah;  
21 and Huntington-Cleveland Irrigation Company in  
22 Huntington, Utah.

23 As I indicated earlier, the proceedings will be  
24 transcribed this evening. Mr. John F. Greenig is going  
25 to act as the court reporter. If you are interested in  
a transcription of the hearing, they are available from

1 Mr. Greenig through the Carbon County Court Complex in  
2 Price, Utah. There will also be a copy of the transcript  
3 available in the public records of the Division of Oil,  
4 Gas and Mining in Salt Lake City.

5 As a basis for the review and decision that the  
6 Division will make on this matter, the record will  
7 include all public records of the Division of Oil, Gas  
8 and Mining that now exist and are available for the  
9 public in Salt Lake, including documents and reviews  
10 conducted by the Division staff as part of the reviews  
11 for Permit renewal and revision of the Permit.

12 The objections that have been filed, and the res-  
13 ponse to the public comment period by the objectors will  
14 be considered, and all information presented this even-  
15 ing, as part of the informal hearing.

16 I would stress that this is an informal hearing.  
17 There will not be sworn testimony. The purpose of the  
18 record is to ensure that we have a complete and accurate  
19 notation of information that's presented tonight.

20 On the basis of the comments tonight and the fore-  
21 going information I mentioned, the Division will consider  
22 the objections that are raised with respect to the issu-  
23 ance of the Permit and status of the revisions that have  
24 been applied for.

25 At this time I would like to provide an opportunity

1 for introduction. Tonight representing the Division will  
2 be Pamela Grubaugh-Littig, who is the Permit Supervision  
3 responsible for the Bear Canyon Permit; Tom A. Mitchell,  
4 who is an Assistant Attorney General for the State of  
5 Utah and representing the Division of Oil, Gas and  
6 Mining; Tom Munson, who is a hydrologist with the  
7 Division and knowledgeable in terms of the Bear Canyon  
8 Permit; Vicky Bailey, who is in the back of the room, is  
9 responsible for the sign-in's tonight.

10 And I would encourage you, if you have not signed  
11 in, to please do so this evening and particularly if you  
12 are not with one of the objectors and you wish to make  
13 additional comments this evening.

14 Is there someone here representing Castle Valley  
15 Water Users' Association?

16 MR. LEAMASTER: (Indicating)

17 MS. NIELSON: Would you stand and identify  
18 yourself, please, for the record?

19 MR. LEAMASTER: I'm Darrel Leamaster. I'm  
20 District Manager of the District.

21 MS. NIELSON: All right. For North Emery Water  
22 Users' Association?

23 MR. COPINGA: Menco Coppinga, the president of  
24 the company.

25 MS. NIELSON: Okay.

1 MR. APPEL: And I'm Jeffrey Appel, representing  
2 this company.

3 MS. NIELSON: And for Huntington-Cleveland  
4 Irrigation Company?

5 MS. WILSON: I'm -- Dale Wilson was not able to  
6 be here tonight, so I'm representing the company for him.

7 MS. NIELSON: All right. Co-Op Mining Company?

8 MR. OWEN: Wendell Owen, Co-Op Mining.

9 MR. KINGSTON: Carl Kingston. I represent Co-Op  
10 Mining Company.

11 MS NIELSON: Thank you. As we go forward and  
12 present information and you ask your questions, in order  
13 to make sure that we can accurately hear them and record  
14 them, I've asked you to come forward and use the micro-  
15 phone here on the podium. According to the sheet I have,  
16 there are -- let's see -- Scott Johansen will be repre-  
17 senting Castle Valley?

18 MR. JOHANSEN: Huntington City.

19 MS. NIELSON: Huntington City. Okay.

20 MR. MANGUM: I'm a consultant for Co-Op Mining.

21 MS. NIELSON: Okay. Mr. Stoddard, Co-Op Mining  
22 also?

23 MR. STODDARD: Yes.

24 MS. NIELSON: Okay. At this point, except for  
25 those names that I've mentioned and the individuals who

1 have introduced themselves, I'm not aware that any other  
2 party wishes to make comment.

3 I would suggest the procedure --

4 MR. MANGUM: (Indicating)

5 MS. NIELSON: Excuse me.

6 MR. MANGUM: Dianne, as part of the comments I  
7 would make, we're also going to have Bryce Montgomery,  
8 consulting geologist.

9 MS. NIELSON: Thank you. And I appreciate that.  
10 As part of the procedure, I guess I'd suggest that we  
11 allow the three objectors to go first and present their  
12 information; provide an opportunity for Co-Op Mining to  
13 do the same. And then I would like to open the session  
14 to questions of all of those parties. And then if time  
15 allows and there are other individuals who want to make  
16 additional comment, we would take them after -- after  
17 those presentations and questions.

18 I'm not certain -- Mr. Leamaster, do you want to go  
19 first, or --

20 MR. LEAMASTER: (Indicating affirmatively.)

21 MS. NIELSON: Okay. And if you would like to  
22 introduce anyone else also, you can do that -- that will  
23 be presenting comments on behalf of --

24 MR. LEAMASTER: Can I state my name?

25 MS. NIELSON: Please do.

1 MR. LEAMASTER: My name is Darrel Leamaster.  
2 I'm a resident of Huntington, Utah. I'm a registered  
3 professional civil engineer in the State of Utah. I'm  
4 employed as the District Manager for the Castle Valley  
5 Special Service District in Castle Dale.

6 I would like to acquaint you for just a moment with  
7 the Castle Valley Special Service District so that you'll  
8 be able to recognize our relationship to the Spring and  
9 to Huntington City and Cleveland and Elmo. Our District  
10 is regionalized or consolidated type district that  
11 handles water -- culinary water, pressurized irrigation  
12 water, sewer and roads for seven communities in the west-  
13 ern half of Emery County. We provide water services for  
14 the towns of Huntington, Cleveland and Elmo. We basically  
15 have intergovernmental agreements with those communities  
16 that allow us to do the operation and maintenance on  
17 their systems. So, that is the way that we're tied in  
18 with Huntington, Cleveland and Elmo. We actually operate  
19 and maintain the systems for them under their guidance  
20 and direction.

21 I would like to mention that we are working jointly  
22 with the North Emery Water Users in regards to this hear-  
23 ing. We have met and feel that we have common concerns  
24 and common interests. And we are working together with  
25 them. We have together hired a consultant, a geologist,

1 who later will be addressing us, and his name is Bryce  
2 Montgomery.

3 The way that we would like to proceed tonight, I  
4 would like to talk for a little while. Then following my  
5 remarks, I would like to have Menco Coppinga speak; and  
6 then Bryce Montgomery; and then Scott Johansen, who is an  
7 attorney with us in Huntington City; and then Jeff Appel,  
8 who is an attorney for North Emery Water Users.

9 MS. NIELSON: Mr. Leamaster, could I also  
10 request that you and the speakers that follow, to the  
11 extent that you're addressing specific objections in the  
12 letter that you filed with us, could you identify those  
13 so that we can follow along with the testimony?

14 MR. LEAMASTER: I'll try. I really wasn't pre-  
15 pared to handle it that way, but I'll attempt to do that.

16 MS. NIELSON: Okay.

17 MR. LEAMASTER: To begin with, I would like to  
18 speak quite bluntly and to the point about why we raised  
19 objections and about why we requested this hearing.

20 First of all, let me say that our District and North  
21 Emery Water Users has, as our goal, the goal of providing  
22 safe drinking water in abundant supply of good quality  
23 and taste to all of our customers. And we regard that as  
24 no light matter. We're talking about four or five thous-  
25 and people who depend upon us for their drinking water.

1           And let me suggest that there's no product that  
2 comes into our home that is more closely related to our  
3 health and our well-being than our drinking water. We not  
4 only drink it, but bathe with it; we brush our teeth with  
5 it; we wash our dishes, we cook our food with it. We're  
6 in very close contact with it in everything that we do in  
7 our homes. So anything that happens to that drinking  
8 water source to contaminate it or to ruin its quality, is  
9 really of significant impact upon our customers. And we  
10 really stress that, and we pay a lot of attention to it.

11           There are some tremendous liabilities that are  
12 placed upon us as water purveyors in providing a safe  
13 drinking water supply. Those liabilities come upon us  
14 through federal and state regulations and through common  
15 life. We have to provide safe drinking water.

16           We would like to stress that those same liabilities  
17 also fall upon the Co-Op Mine; that they, too, do not  
18 contaminate our water supply and cause harm to the public  
19 health and to our customers. We're concerned that in the  
20 work that they've done, they have not placed adequate  
21 importance on that safety impact.

22           Now, in a minute, I'm going to talk about -- a  
23 little bit about how our systems work. But we are very  
24 vulnerable to contamination to those springs. The water  
25 from those springs is never exposed. It comes out of the

1 mountain into our pipelines and then is delivered into  
2 our system. There is no way that we can effectively moni-  
3 tor day-in and day-out exactly what those springs are  
4 doing.

5 We do monitor, as required by the State Health  
6 Department, all of the inorganic chemicals, the coliform  
7 tests and so forth that are required. Those tests are  
8 done, as far as coliform, on a monthly basis and the  
9 other things on a yearly or three-year basis. It doesn't  
10 assure us that we will always catch contamination that is  
11 coming into the system, and we are very vulnerable to  
12 that.

13 And so we are extremely concerned about anything  
14 that the Co-Op Mine does that might effect those springs.  
15 We believe that in the mine application, particularly in  
16 Chapter 7 that deals with hydrology, that there are many  
17 things that were not adequately addressed, and there are  
18 some conflicting statements in there that leaves us with  
19 a lot of questions as to the results. They talk in some  
20 places about water going from the stumps into cracks and  
21 fractures that will end up in our springs. And yet in  
22 other places in that same Chapter, they say they will not  
23 do anything at all to effect our springs.

24 Throughout that Chapter, they have not adequately  
25 addressed what will happen should they interfere with

1 either the quantity or the quality of that spring flow.  
2 We believe that you should require them to go back and to  
3 rework that Chapter and more adequately address those  
4 concerns. We don't think what is there now is adequate.

5 We believe that in some respects the Co-Op Mine has  
6 already interfered with both our Big Bear Spring and with  
7 the Birch Spring. And we did refer to that in our letter  
8 requesting this hearing. We feel that in our case, with  
9 the Big Bear Spring, that we have suffered decline in  
10 flow. And the most recent inorganic chemical tests that  
11 we have taken have shown a sharp rise in the sulphate  
12 content in the dissolved solid's content which we think  
13 they're also attributed to actions that they are taking  
14 in the mine.

15 We are concerned that the past ground water monitor-  
16 ing that they have done has been inadequate. They have  
17 not done those things that they were to do in the first  
18 granting of their application. We have never been con-  
19 tacted about them sampling from our spring sources; of  
20 getting permission to get into those. They are padlocked  
21 and closed, and we don't know of any time that they have  
22 been into our springs to sample them. We have never been  
23 the recipients of any of the information of their sam-  
24 pling and monitoring tests. They only information that  
25 we have ever seen is that that was published in the

1 application report. We feel that we should be directly  
2 involved in receiving that information back on a timely  
3 basis so that we can see what's going on.

4 We feel very strongly about the monitoring require-  
5 ments, and we feel that until we can have been assurance  
6 that they will monitor the way that they talk about in  
7 the application and the way that they're required to by  
8 the regulations, that you should deny the Permit and pre-  
9 vent them from proceeding until we have assurance that  
10 that monitoring will be done.

11 In the report in the--I mean Chapter 7 in Hydrology  
12 -- in several places they state that they will not have  
13 any effect on our springs. We disagree quite strongly  
14 with that statement. We do like to raise the question of  
15 what they would do if, in fact, they do interfere either  
16 with quality or quantity of the spring. What assurance  
17 do we have that that water will be replaced; that we can  
18 have a safe supply to provide to our customers? And what  
19 assurance do we have, as far as financially, that they  
20 will be able to meet those demands and provide that  
21 source of water? We could point out that this area is  
22 very poor, from a standpoint of quantity of water for  
23 other sources that they can obtain and use to put into  
24 our system. Between us and North Emery, we have used up  
25 about all the available sources that are in the area. So

1 if a source is lost, it's going to be a difficult problem  
2 to replace it. And we would like to have them address  
3 how that will be done, if they do effect it.

4 I would like to now acquaint you more with our water  
5 system and how we provide water in these communities. I  
6 have some handouts here; probably not enough for every-  
7 one, but at least enough for you (indicating). I have on  
8 the screen a partial slide of the top sheet that you have  
9 there. This is a general overlay of the area. Notice in  
10 the middle on the right side, the darkened area is the  
11 community of Elmo. Down from it and farther to the left  
12 is the community of Cleveland, and then the larger area  
13 of Huntington.

14 MS. NIELSON: Mr. Leamaster, excuse me. Could  
15 we -- just for purposes of the record, maybe number these  
16 1, 2, 3, 4 as we go along?

17 MR. LEAMASTER: That will be fine.

18 MS. NIELSON: And we'll refer to this one as  
19 Exhibit 1?

20 MR. LEAMASTER: That will be fine.

21 MS. NIELSON: Okay.

22 MR. LEAMASTER: I would have done that, but I  
23 didn't really know if that's what you wanted.

24 MS. NIELSON: That's fine. We'll just handle  
25 it that way.

1  
2 MR. LEAMASTER: These three communities are all  
3 served on a consolidated or common system. They were put  
4 together about, what, four or five years ago. Before that  
5 Huntington alone was served by water out of Bear Canyon  
6 Spring. At this time all three communities are served by  
7 the water from that spring.

8 Bryce, would you slide that over now so we can see  
9 the rest of it?

10 MR. MONTGOMERY: (Indicating)

11 MR. LEAMASTER: That's upside down.

12 MR. MONTGOMERY: (Indicating)

13 MR. LEAMASTER: I might also point out that  
14 those areas outside those communities that are not within  
15 the boundaries of the communities are served by North  
16 Emery Water Users. We have basically parallel systems  
17 that come down Huntington Canyon.

18 Bryce, can you slide that a little bit more? I would  
19 like to see those other two springs on there. Will it  
20 come down towards me a little more?

21 MR. MONTGOMERY: (Indicating)

22 MR. MUNSON: Could we have somebody hit some  
23 more lights there in the back?

24 SPECTATOR: (Indicating)

25 MR. LEAMASTER: Oh, that's better.

MS. NIELSON: Can you see okay?

1 MR. LEAMASTER: Yes, that's fine.

2 MS. NIELSON: Okay.

3 MR. LEAMASTER: On the upper part you will see  
4 a reference to Tie Fork Canyon Spring. That spring is  
5 located about fourteen-and-a-half miles away from  
6 Huntington. And we are piped from that point down to the  
7 State highway, which is near the point where you see the  
8 sign that says Little Bear Spring. We are then piped  
9 from that Little Bear Spring paralleling the State  
10 highway, which is Highway 31, down through the canyon.  
11 You'll see about in the middle the Bear Canyon Spring.  
12 That is piped from the spring down again to the highway,  
13 where it joins in with the transmission line from those  
14 other two springs. The line then continues down the  
15 canyon past the Utah Power & Light generating plant down  
16 through the area where you see the water treatment plant  
17 location. At that point we have a million gallon storage  
18 reservoir. The water is then piped from there in two  
19 separate lines: one directly to Huntington and the other  
20 directly to Cleveland and to Elmo. Those three springs  
21 make up the bulk of our water supply.

22 That water treatment plant has not been used for  
23 about eight years, and it has some problems with its use  
24 that's probably not pertinent to this hearing. But let  
25 us just say that it is a single path system. By that we

1 mean it has one percolator, one filter, one flash mixer.  
2 Everything is single. The Health Department has rated  
3 that plant based upon our spring. Because it is a single  
4 path plant, if anything breaks down, we have to rely on  
5 the spring. And so any expansion of that plant would  
6 have to require essentially doubling the plant size,  
7 which would be extremely costly.

8  
9 May I have the next slide now, Bryce, please?

10 MR. MONTGOMERY: (Indicating)

11 MS. NIELSON: And we'll call this Exhibit 2.

12 MR. LEAMASTER: Okay. This is a fairly simple  
13 slide. All I've done is indicated here the number of  
14 water connections that we serve in Huntington and in  
15 Cleveland and Elmo, and the population -- the approximate  
16 population that we're serving. We have about a thousand  
17 and fifty-one connections and approximately three thous-  
18 and people who are being served by our system. We expect  
19 shortly to receive a new census number, so we'll have a  
20 better handle on those populations. But those are our  
21 best estimates.

22 Again, let me stress the importance that we put on  
23 providing safe drinking water to those three thousand  
24 people. I live there. My wife and my children live there.  
25 My close friends and my family are all there. And we are  
really concerned about providing safe drinking water to

1 these three thousand people.

2 Would you go on to the next one now, please, Bryce?

3 MR. MONTGOMERY: (Indicating)

4 MS. NIELSON: This will be Exhibit 3.

5 MR. LEAMASTER: Yes. This will be Exhibit 3.

6 This exhibit shows the flows that we have reported from  
7 the Big Bear Spring since 1983. Now, we do have addi-  
8 tional flow data that is very good, but to the year 1980.  
9 Prior to the year 1980, we have only sketchy information.  
10 We installed meters in about 1980 and read those meters  
11 on the 15th of the month and the 31st of the month. And  
12 we have consistently done that since 1980. So we have  
13 very excellent flow data from that point forward.

14 I've only indicated from 1983 forward here, because  
15 in late 1982 the Tie Fork Springs were added into the  
16 system. You'll notice the second column there is the  
17 total spring flow from all of our springs. And the last  
18 column is the percentage of the total flow that is coming  
19 from Big Bear.

20 Now, there are a couple of significant things that  
21 I would like to point out. As you look down the column  
22 of the flow from Big Bear Springs, '83, '84, '85 and '86  
23 were all quite high. And the flow has dropped in '87,  
24 '88, '89 and in '90. Now, in those four years we have  
25 experienced a drought in this area, and our precipitation

1 has been below normal. That's complicated the problem of  
2 trying to determine whether their operation has affected  
3 our spring flow in the past. We unfortunately don't have  
4 any data from 1977, which was the last year of severe  
5 drought in the area.

6 If you'll look over into the last column on the per-  
7 centage of flow, you'll notice in those first few years  
8 Big Bear was providing approximately 33 percent or a  
9 third of our total flow. Beginning in 1987, that percen-  
10 tage has begun to drop. And it dropped down to a point  
11 now where less than a fourth of our flow is coming from  
12 Big Bear Spring. Now, all through these springs are  
13 fairly closely -- fairly close as far as distance between  
14 them. And we don't feel that the recharge areas are that  
15 much different. So what I'm suggesting here is something  
16 has happened to us beginning in 1987 to affect the flow  
17 out of Big Bear Spring; because its percentage has drop-  
18 ped in relationship to the flow of our other spring. I'll  
19 refer to that again on another exhibit.

20 Let's have the next one, Bryce.

21 MR. MONTGOMERY: (Indicating)

22 MR. LEAMASTER: Now, in your pack you will have  
23 two exhibits that I'm not going to put on the board. One  
24 of them is the precipitation, and the other is the April  
25 1 snowfall accumulations.

1 MS. NIELSON: Do you want those both consider-  
2 ed, though?

3 MR. LEAMASTER: Let's number those and consider  
4 them as exhibits.

5 MS. NIELSON: Okay. We'll call those Exhibits  
6 4 and 5.

7 MR. LEAMASTER: Okay. I would mention that the  
8 information from these comes from three of the sites that  
9 are monitored by the Soil Conservation Service. They're  
10 the three that are closest to our spring: the Red Pine  
11 Ridge, the Mammoth Cottonwood -- and those two are Snow  
12 Tell sites -- They started snow tell automatic readouts  
13 in 1982. Before that they were manually read. And then  
14 the third site is at the Stewart Ranger Station, which is  
15 manually read. The numbers on the first one are the total  
16 yearly precipitation figures. And on the Exhibit 5 are  
17 the April 1 snow/water equivalent at those stations.

18 Now, the next exhibit, which I guess is 6, if I'm  
19 right --

20 MS. NIELSON: That's correct.

21 MR. LEAMASTER: (Continuing) -- is on the  
22 board. This is a chart that we've plotted up comparing  
23 the yearly precipitation to the spring flow. And, unfor-  
24 tunately, you can't see the other column -- the other  
25 side of this right now. The two are not related, as far

1 as the lines across. We plotted with the dotted line the  
2 precipitation and with the solid line the flow from our  
3 springs. What we're looking for here is a correlation  
4 between the precipitation and the spring flow. We feel  
5 like we have a good correlation until we get over to the  
6 year starting in about 1987 and '88, where the precipita-  
7 tion levels off and goes basically straight across. But  
8 you'll notice the shape of our flow curve continues to  
9 drop straight off and has continued to drop until just  
10 the last few weeks when it has come back up slightly.

11 We believe there is some significance in that break.  
12 And again, it's pointing to around 1987 and 1988. And we  
13 feel that something has happened to change those flow  
14 patterns out of the spring.

15 Now, Bryce, if you could put on the next one?

16 MR. MONTGOMERY: (Indicating)

17 MR. LEAMASTER: This curve is very similar,  
18 except rather than the total yearly precipitation fig-  
19 ures, this is the April 1 snow/water equivalent at those  
20 stations. And again, as you look at the curve, we have  
21 a good correlation with the snow/water equivalent and the  
22 spring flows until we get over to the area of 1987 and  
23 '88, where the spring flows continue to drop and the pre-  
24 cipitation levels off. We feel that we have had an impact  
25 from the mining operation during that point in time; and

1 that our curve should have leveled off more in line with  
2 the snow/water equivalent and the precipitation curve.

3 That's all the slides I have. If I could have the  
4 lights back on, please?

5 MS. NIELSON: And we'll refer to that last  
6 graph as Exhibit 7.

7 MR. LEAMASTER: I'm just about ready to wind  
8 up.

9 (Whereupon, an off-the-record dis-  
10 cussion was had.)

11 MR. LEAMASTER: Just in summary, let me say  
12 that we already believe that our Big Bear Spring has been  
13 affected. Our recent inorganic chemical tests, as I've  
14 indicated, are showing a marked increase in sulphates and  
15 TDS. The flows in the last month have jumped from 115  
16 gallons a minute up to around 129 gallons a minute. We  
17 have no explanation for that. We think that it may be  
18 related to where they're moving and storing water within  
19 the mine. We believe that even if they ceased their  
20 mining operation right now, that we have already had some  
21 impacts from the mining operation. And we really don't  
22 know how those are going to effect us over the long run.

23 So in conclusion, what I guess we're saying is we  
24 would like you to hold off and not approve this applica-  
25 tion until such time as this can be more thoroughly

1 investigated; have a better Chapter 7 on the hydrology to  
2 more adequately answer our concerns.

3 And I thank you for your time and now turn the mike  
4 over to Menco Coppinga.

5 MR. COPINGA: My name is Menco Coppinga. I'm  
6 the president of North Emery Water Users. It's a non-  
7 profitable organization, and there's about -- there's  
8 seven Board members. And there's two from each location:  
9 two from Elmo area, two from Cleveland area, two from  
10 Lawrence, and one at large.

11 Like I say, we are a nonprofitable organization, and  
12 we are a small company. We have about 417 connections;  
13 roughly around a thousand people that are on our system.

14 The spring at Birch Creek is really important to us.  
15 We have at this time about 150 gallons of water coming  
16 down the mountain. Of that 150 gallons, we've got 33  
17 gallons coming out of Birch Springs, which is roughly  
18 about 20 percent of our water system. We're concerned  
19 that if we lose this 20 percent, that we won't be able to  
20 supply our demand for water in our area. We have still  
21 other springs up the canyon. We have a couple springs up  
22 in Rilda Canyon and several down the canyon, which is  
23 about, oh, roughly 20 percent from Birch, 50 percent from  
24 Rilda, and the rest of them is from the other springs  
25 down the canyon. We really can't afford to lose this

1 particular spring.

2 Also, last year we had a problem with the spring.  
3 This spring at the time was roughly flowing about 40  
4 gallons per minute; and in just several days, it went up  
5 to almost 300 gallons per minute. The water was dirty.  
6 We had it checked, and it had coliforms in it, and it  
7 also had oil in it. We contacted DOGM, and they sent  
8 somebody down. We looked the situation over, and they  
9 couldn't find anything on the outside where they might  
10 have been some -- There might have been some water dumped  
11 someplace else, but we couldn't find any there. And over  
12 a few months, it just kind of decreasing back down again  
13 to where it has been going down ever since then. And  
14 like I said, it's about 33 gallons per minute at this  
15 time.

16 There are a lot of concerns, as Darrel mentioned,  
17 that are ours also, so I won't go into that. And we are  
18 concerned, and we would like to have something done about  
19 these springs.

20 MR. MITCHELL: Just so the record is clear, the  
21 increase of flow occurred when?

22 MR. COPINGA: It was -- The chart right here --  
23 It was about January of '89; is that right?

24 MR. LEAMASTER: October.

25 MR. COPINGA: October of '89.

MR. LEAMASTER: It jumped up.

MR. COPINGA: It jumped up. And it went --

MR. LEAMASTER: To January.

MR. COPINGA: To January. And it started going back down in January. And from January, it went down from roughly 225 gallons to about 75 gallons in this one month. Okay. Thank you.

MR. MONTGOMERY: My name is Bryce Montgomery. I'm a consulting geologist. And I have made a study of the area at the request of the two Districts. And it's difficult to present here in brief all that is in the report, which will be presented to the Oil and Gas Division here as an exhibit. This is a chart of the rock formations present in the area, as reported by Danielson and others, who are with the U.S. Geological Survey. They did quite an extensive study of the area some time ago in the early 80's.

But I would like to just familiarize you with some of the names here, because we'll be talking about them, and give you some idea of the relationship of these rock formations, as we're talking about these springs and the mine and the coal and so forth.

We might liken these rock strata to the layers such as you would see in a sandwich or a layer cake. And the rock strata in the area are nearly horizontal. They do

1 have a very moderate dip of only a couple degrees to the  
2 south-southeast. And what we find in the area right in  
3 the bottom of the canyon, as you go up Huntington Canyon,  
4 the gray, prominent shales, which all of you, I'm sure,  
5 are familiar with, and I refer to as Mancos Shale Forma-  
6 tion. Those are the shales in the bottom of the canyon  
7 that are quite impervious to infiltration movement of  
8 ground water.

9 Above the gray shales we have the Star Point  
10 sandstone, which is about 400 feet thick. And there's a  
11 gradation boundary here between the two. And it's the  
12 Star Point sandstone that the Birch Spring and the Big  
13 Bear Spring discharge from. So that's important to  
14 remember that.

15 Above the Star Point sandstone we have the Blackhawk  
16 Formation, which is approximately 700 feet thick. And  
17 it's the Blackhawk Formation that is made up of several  
18 sandstone beds embedded with thin shales and prominent  
19 coal beds which are mined. So the coals that are mined  
20 in the area come from the Blackhawk Formation: one near  
21 the base of the formation referred to as the Hiawatha,  
22 and then one up higher in the section that some refer to  
23 as the Blind Canyon, others as the Bear Canyon. The  
24 Castlegate sandstone overlies that section, and its  
25 prominent ledge up high on the ridge line that you see

1 near the top, and it's about 200 feet thick.

2 Above that is a sequence of sandstones and shales  
3 known as the Price River Formation, approximately 600 to  
4 700 feet thick. And then the capping formation on the  
5 high area north of the mine; and that mine -- or high  
6 above the mine. And then to the north is the North Horn  
7 Formation, which is about 800 feet thick and is composed  
8 of embedded shales and sandstones.

9 The Flagstaff Limestone is found further west than  
10 south and north, but she wrote it off in the area that we  
11 have of concern here. There is a limestone bed, though,  
12 in the north part that resembles the Flagstaff, and some  
13 have called that the Flagstaff in the area.

14 It's important to keep in mind that these formations  
15 all have sandstone beds within them that are easily  
16 fractured, due to the structural forces incurred in the  
17 earth. And it's through these fractures and faults that  
18 the water is able to infiltrate from the precipitation on  
19 the high areas and move downward to permeable formations  
20 that become aquifers.

21 Let me put another slide here (indicating).

22 MS. NIELSON: Could we refer to this as Exhibit  
23 8?

24 MR. MONTGOMERY: That would be fine.

25 MS. NIELSON: All right. And the next one will

1 be Exhibit 9.

2 MR. MITCHELL: Would you identify the source of  
3 these?

4 MR. MONTGOMERY: Yes. This is from Brown and  
5 others, who did some mapping for the U.S. Geological  
6 Survey. And the exact reference is in the report that  
7 you'll get a copy of. But this is one of the measured  
8 sections. Well, there are several measured sections taken  
9 right on the point in the vicinity of both springs and  
10 both the Trail Canyon Mine and the Bear Canyon Mine that  
11 is presently operating. It's an enlarged section merely  
12 showing the top of the Star Point Sandstone, then going  
13 up into the Blackhawk Formation. The reason I wanted you  
14 to see this is that this is the basal coal, the Hiawatha  
15 coal. This is the coal they're mining now presently in  
16 the Bear Canyon. And there was earlier a lower bed,  
17 which they also have referred to as the Hiawatha. But  
18 these geologists have shown it's not exactly parallel  
19 with it, although it's at the base of the Blackhawk  
20 Formation. But this scale gives you an idea. This is  
21 about ten feet on here, so it gives you an idea of the  
22 relationship of these coal beds.

23 So the Hiawatha coal bed is about 50 to 80 feet  
24 below the Bear Canyon coal bed, which is being mined at  
25 the present time. This bed was mined off in -- (indicat-

1 ing) -- in Trial Canyon Mine in earlier times, which  
2 closed about 1982. And I'll show a map here as to where  
3 that's located (indicating). This is a map by -- The base  
4 map is actually by Brown and others from U.S. Geological  
5 Survey, on which it showed the topographic contours of  
6 the area, the configuration of the present day land  
7 surface. And they have also shown in a heavy line here  
8 the contact between the Star Point Sandstone and the  
9 Blackhawk Formation. That's this heavy line (indicat-  
10 ing). And that -- Those measured sections that I just  
11 had on display are from this area, which is the location  
12 of the Bear Canyon Mine, around this point (indicating),  
13 over to the Trail Canyon Mine, which is in this area  
14 (indicating) -- Co-Op Mine here (indicating).

15 MS. NIELSON: Are those sections actually  
16 marked on the map for reference, the locations?

17 MR. MONTGOMERY: Yes. They're numbered right  
18 here (indicating).

19 MS. NIELSON: Okay. Thank you. And we'll  
20 refer to this map as Exhibit 10.

21 MR. MONTGOMERY: All right. So what we have  
22 here is Bear Canyon coming down through here (indicat-  
23 ing), and then the main Huntington Canyon going up  
24 through here (indicating). And this is the highway  
25 (indicating). And as I say, these background lines are

1 topographic lines which show the configuration of the  
2 surface.

3       So we have a big, long ridge extending from here  
4 northward (indicating). This is the south end of it.  
5 The highway cuts across here. Bear Canyon Road going up  
6 here (indicating). And superimposed on that topography  
7 we have geology, not in utmost detail, because it would  
8 clutter it even more than it is, and I have to acknowl-  
9 edge its pretty cluttered as it is. But what the U.S.  
10 Geological Survey geologists have found is that there's  
11 actually working within the rock strata -- this line up  
12 here with the arrows is an anticline, and then a syncline  
13 here (indicating). So, there is actually warping within  
14 the rock strata, even though there's generally dipping  
15 back this way to the southeast a couple of degrees. But  
16 since that warping took place in the rock strata, which  
17 helped to fracture the sandstone beds and create second-  
18 ary permeability and porosity in them for the water to  
19 get into and move through and be stored in, we had later  
20 faulting -- normal faulting occurred -- which all of you  
21 heard of the Joe's Valley Fault? Well, these faults are  
22 associated with that, but just a little farther east --  
23 very prominent fault going right up through Huntington  
24 Canyon, which is known as the Pleasant Valley Fault.  
25 This is a fracture in the earth's crust wherein this side

1 -- the west side was moved up approximately 150 feet  
2 relative to the east side, which was dropped down.

3 We have a similar situation on this side, going up  
4 Bear Canyon. It's a very prominent fault. And we have  
5 the upthrown side on the east this time and the down-  
6 thrown side on the west. And that's about 150 feet of  
7 offset or displacement. So what we have is a unique  
8 situation with the gentle warping that I mentioned. We  
9 have what's known as a graben or a down-drop section of  
10 the earth's crust between here and here (indicating).  
11 And so even though this is a ridge and a high area going  
12 back to the north on Gentry Mountain, this is actually a  
13 down-drop section of the earth's crust between these two  
14 faults -- a graben. And it's interesting. It extends a  
15 long distance to the south and -- across Huntington  
16 Canyon into the coal mining area to the south, and then  
17 it extends much farther north.

18 And if I could shift the map here? Maybe if you  
19 wouldn't mind doing that for me, Darrel? That will save  
20 me stepping up there. If you could just shift that map?

21 MR. LEAMASTER: (Indicating)

22 MR. MONTGOMERY: Yea. Just like that. Uh-huh.  
23 Thank you. As you can see, I have only mapped up to just  
24 the Tie Fork Spring that already you've been acquainted  
25 with.

1           But you can see between these two prominent faults,  
2 we have many other faults that parallel them. And the  
3 offsets on these faults are anywhere from perhaps ten  
4 feet up to a hundred feet. They vary. In other words,  
5 with one side being dropped down or the other side being  
6 dropped up. And that's indicated by the symbols here  
7 (indicating). But, you see, this graben area, which  
8 extends northward up on the Gentry Mountain, is a very  
9 unique area that is very broken up. Besides the faults  
10 here, the little dotted lines indicate very prominent  
11 joints. So, there's many joints that parallel these  
12 faults. The precipitation on the high mountain area,  
13 which is about 11,000 feet up on Gentry Mountain, part of  
14 it infiltrates into the fractures.

15           Now, obviously, as water goes down through the frac-  
16 tures, if there's a permeable formation, some of it will  
17 move into it like a sandstone bed. These prominent  
18 faults, though, they tend to transact both the sandstone  
19 and the shale beds and carry water even down through the  
20 shale beds to a deeper depth. The aquifer that we're  
21 concerned about down here at the springs, is actually  
22 made up of the sandstone; not only of the Star Point  
23 Formation, but of the lower part of the Blackhawk Forma-  
24 tion. And water from this high area precipitation is  
25 able to infiltrate and eventually get down to those

1 prominent beds.

2 If I could have you shift that back up again now,  
3 Darrel?

4 MR. LEAMASTER: (Indicating)

5 MR. MONTGOMERY: Thank you. Just a little bit  
6 more. That's fine. Thank you.

7 You see, then these faults act as a -- conduits for  
8 the water to move southward down. And that is illustrat-  
9 ed by these purple dash-hyphen dotted lines. Those lines  
10 represent the dynamic surface of the Blackhawk-Star Point  
11 Formation aquifer. And they represent -- They're known  
12 as potentiometric contours or the potentiometric surface.  
13 That's the elevation to which the ground water will rise  
14 in those aquifers--or in those formations. I'm combining  
15 them as one aquifer because they're closely related. The  
16 water, then, is moving normal to those contours -- moving  
17 like this (indicating) to the south and southwest from  
18 the north.

19 And as you can see between these two major faults,  
20 the effect is to kind of enclose, like a large trough,  
21 the ground water moving from the north to the south.

22 Now, this is the location of the Bear Canyon Spring  
23 right here (indicating). This is the location of the  
24 Birch Spring (indicating). Birch Spring is located dir-  
25 ectly on one of these faults that has approximately

1 twenty feet of offset. This fault goes northward and  
2 branches into several other faults which go clear north-  
3 ward into the high area of precipitation.

4 Bear Canyon comes out along three prominent joints  
5 which have no appreciable offset on them. But it is very  
6 close to this fault here (indicating). And as is shown,  
7 these springs are within this graben area between these  
8 two prominent faults: the Bear Canyon Fault and the  
9 Pleasant Valley Fault.

10 So the waters from the area of infiltration is  
11 southward to recharge these formations and is moving  
12 directly through the mining area. This heavy black line  
13 is the present boundary or permit area for the Bear  
14 Canyon Mine. And the jagged black line is the area that  
15 has been mined or is under mining operations. So for the  
16 old Trail Canyon Mine, which is abandoned and pillars  
17 have been pulled and there's actually subsidence taking  
18 place within the mine -- that's this area right here --  
19 the present day mine is here (indicating). And they have  
20 a permit back to mine in this area (indicating). The  
21 proposed area that they're wanting to expand is the heavy  
22 dotted line here (indicating) and also an 80-acre tract  
23 down here (indicating). So you can see, the mine area is  
24 between the spring discharge points and the recharge area  
25 to the north. And these very prominent joints and faults

1 are the avenues for this water to move to the springs.  
2 And some of the water that's being encountered in the  
3 mines that normally would move downward toward these  
4 springs has been intercepted in their mining operations  
5 and either has been poorly used or diverted away from the  
6 natural fracture system that would allow it to continue  
7 on its journey, as it naturally did to recharge these  
8 springs.

9 Now, as was pointed out to you, in the Fall of 1989  
10 Birch Spring experienced an unusual abnormal situation.  
11 If you would compare the -- which I could do again. I  
12 could put the charts on to compare the precipitation to  
13 the spring discharge. This high rise that was mentioned  
14 in the Fall of '89 into January of '90 was very abnormal  
15 and also a release of about 90-acre feet of water out of  
16 this area into this fault system. And once that storage  
17 and high head had flushed through this area, it dropped  
18 back down again. But it carried with it not only a high  
19 amount of sediment, but also oil residues and coliform  
20 bacteria -- carried it down into this area (indicating).

21 Now, this mine is collapsed now, but it provides a  
22 very easy storage area for ground water that's coming  
23 from the north to collect in this area (indicating).

24 And under an increased head of storage in this old  
25 caved area, it's very easy to understand how water could

1 be held up in storage and a rise in head until enough  
2 pressure was created to cause a break through along the  
3 fault system and discharge up to the spring. And then  
4 once the temporary storage is diminished in this area,  
5 then the flows dropped back down to normal again. And  
6 that's my interpretation as to what happened there.

7 Now, while I got this map here, I would like to  
8 point out that in this area along the face of these  
9 cliffs, there is this water discharging now, spilling to  
10 the surface, that appears to be out of the ordinary. In  
11 fact, there's no sustained vegetation there to indicate  
12 that spring water has been flowing for a long time in the  
13 past. And yet there's been an appreciable amount of  
14 water. And I'll show some pictures illustrating that.  
15 It's discharging out of the cliff near the base of the  
16 mining operations, spilling down the face of the cliff  
17 over the shales and forming large icicly deposits in this  
18 vicinity (indicating). And even some of this water now  
19 apparently is able to get back into some of the fracture  
20 zones. Because the recent analysis in January of 1991  
21 showed that the sulphates have doubled in the spring from  
22 what they have been over the past. And the total dis-  
23 solved mineral solids have gone up better than 25 percent  
24 in that spring.

25 So, it's quite obvious that the mining operation in

1 this area has had an effect on these springs. And as it  
2 was pointed out by Darrel, these springs have gone down  
3 in their rate of flow.

4 I would like to show a cross section now that will  
5 be from the Tie Fork Spring down through this area and  
6 through the Bear Canyon Spring and to this point (indi-  
7 cating). Can you turn it around?

8 MR. LEAMASTER: (Indicating)

9 MR. MONTGOMERY: Yea, thank you. This is north-  
10 west up here (indicating). And, by the way, this is the  
11 true scale on the other map. So the relationships here  
12 are not abnormal, so far as the vertical scale, which is  
13 often done on cross sections. If you're to take a slice  
14 down through the earth's section in this area, this is  
15 what it would look like. This is the profile of the  
16 topography here at the top. The different letters desig-  
17 nate those different rock formations that I mentioned  
18 earlier. Here is Tie Fork Spring and Tie Fork here  
19 (indicating). The water there is discharging from a  
20 drill hole that was drilled down into the Star Point  
21 Sandstone and comes up to the ground level. This heavy  
22 dot-dash purple line here represents that potentiometric  
23 surface of the Star Point-Blackhawk aquifer. And as you  
24 can see, it has a gradient higher here and moving down  
25 this way (indicating). Now, of course, as it cuts across

1 faults, there will be some adjustment in it, and I can't  
2 show that detail because I don't know exactly how much it  
3 is. But, in general, it stays approximately on this line;  
4 and as it crosses the faults, there are some irregulari-  
5 ties. But we do have a drill hole that was drilled up on  
6 the high mountain area by Savage Energy Services -- drill  
7 hole T-4, which did penetrate these units. Besides we  
8 have mines and drill holes, but further north in the  
9 recharge area west of Hiawatha that gives us further  
10 control on what the elevation is on that surface.

11 Here it was fifteen hundred feet from the surface.  
12 And then as we move further south -- if you wouldn't mind  
13 now slipping that down for me, Darrel?

14 MR. LEAMASTER: (Indicating)

15 MR. MONTGOMERY: That's fine. Thank you. As  
16 we move farther south, you can see that gradient just  
17 dropping and to where -- Here is the discharge point of  
18 Bear Canyon Spring (indicating). That's the top of that  
19 gradient (indicating). Here is the mine operation from  
20 here -- this line here to here (indicating). And the  
21 proposed operation would extend it farther over to here  
22 (indicating). And as you can see, this heavy black line  
23 here represents the Bear Canyon coal that is presently  
24 being removed in the Bear Canyon Mine. Now, the gradient  
25 for this major aquifer is down below that surface,

1 although we do have some water through these sandstones  
2 working its way down and they have intercepted some of  
3 that water. Now, especially in the north end of their  
4 mine, they've encountered about a hundred gallons per  
5 minute reported in this area (indicating). And they are  
6 intercepting and using that water or -- and some of it is  
7 being used out of the mine down for other uses, both  
8 inside and outside the mine.

9 So you can see, that water that they are intercept-  
10 ing and -- that's not able to get back into the fracture  
11 system; is not able to get back into this recharge area  
12 and contribute to the springs. This applies both to the  
13 Birch Spring and the Big Bear Spring. Even though this  
14 line goes through the Big Bear Spring, it applies equally  
15 to the Birch Spring. In fact, the Birch Spring has higher  
16 permeability delivering water to it than does the Big  
17 Bear, because of the faulting.

18 But you'll notice that if they continue to move up-  
19 dip to the north, which is only about 2 degrees, compared  
20 to the slope of this potentiometric surface, which is  
21 much steeper, they're going to come near intersecting  
22 that main aquifer. In fact, if they go in on the lower  
23 coal, the Hiawatha coal, which is about on this line  
24 (indicating), they will intersect it sooner; in fact, it  
25 will have a greater impact than the mining of the upper

1 coal.

2 But this gives you an understanding; a relationship  
3 of how the coal bed is relative to this potentiometric  
4 surface, this spring elevation and the boundaries of the  
5 existing mine and the proposed mine.

6 It's very obvious to me that as this operation moves  
7 further north, more water will be encountered. If that  
8 water is intersected and not allowed to get back into its  
9 natural conduit system to contribute to both springs, it  
10 will subtract from their supply. Furthermore, if con-  
11 taminants in the mining operation get in to these faults  
12 and fractures, they will carry those contaminates down  
13 towards the springs.

14 Could I have the next sheet on there, Darrel?

15 MS. NIELSON: Mr. Montgomery, can we refer to  
16 that cross section as Exhibit 11?

17 MR. MONTGOMERY: Sure.

18 MS. NIELSON: And I believe that was AA Prime?

19 MR. MONTGOMERY: That's correct. You're right.

20 MS. NIELSON: Thank you. And this one will be  
21 Exhibit 12.

22 MR. MONTGOMERY: Okay. And as I mentioned,  
23 Dianne, we'll provide the full report to you which will  
24 have all of these in it, and you'll have that.

25 MS. NIELSON: Fine. Thank you.

1           MR. MONTGOMERY: This shows a close-up of the  
2 Big Bear Spring issuing from prominent joints -- three  
3 very prominent joints here, and these are the discharge  
4 points that are collected into this box (indicating).  
5 This is the Star Point Sandstone; the lower section of  
6 it. Mancos Shale is concealed by alluvium here (indicat-  
7 ing), unconsolidated fill in the valley. But it would be  
8 below here (indicating). And so you see, the water comes  
9 down, and since it can't go deeper, it is reflected out-  
10 ward, and the erosion has intersected these joints and  
11 made it very easy for it to come to the surface. In fact,  
12 some of this water has come out a little bit higher than  
13 here (indicating).

14           If I could have the next one, please?

15           MR. LEAMASTER: (Indicating)

16           MR. MONTGOMERY: Now, this is a view looking at  
17 that same sandstone bed, the spring area in this area;  
18 and looking back up higher. And this shows, then, the  
19 approximate contact of the Star Point Sandstone in this  
20 area relative to the Blackhawk Formation above. And the  
21 coal beds are in this vicinity (indicating). In this  
22 area right here (indicating), there's an appreciable  
23 amount of water spilling to the surface now that appears  
24 to be abnormal. Possibly some may have spilled naturally  
25 in the past, but it appears to be much more than has

1 occurred in the past.

2 If I could have the next one, please?

3 MR. LEAMASTER: (Indicating)

4 MR. MONTGOMERY: We're looking northwest there.

5 MS. NIELSON: This photo will be 13, and the  
6 next one will be 14.

7 MR. MONTGOMERY: This is a little closer now  
8 and a little higher. And this is Big Bear Canyon here  
9 (indicating). This white or these icicles build up (indi-  
10 cating). It doesn't show all the area, but there's some  
11 here. There's some out here. There's some down below.  
12 These are mainly shale sections here, and this is sand-  
13 stone, the upper part of the Star Point; and this is up  
14 in the Blackhawk (indicating). And there's an apprecia-  
15 ble amount of water spilling out and freezing in the form  
16 of icicles here (indicating). Some of this water is meet-  
17 ing, running down over these shelves and then eventually  
18 gets into a bench area here and some back into the frac-  
19 tures of the spring directly below. I believe that part  
20 of the sulphates, at least, some, perhaps, is coming from  
21 in the mine, but part of it is probably just coming from  
22 leaching these shales as it spills down over them.

23 If I could have the next one, it will be a closer  
24 view, please.

25 MR. LEAMASTER: (Indicating)

1 MR. MONTGOMERY: Now, this is a closer view of  
2 those sandstone beds, water spilling out of them, and  
3 then shale beds interbedded sandstone here (indicating).  
4 This is an appreciable amount of water. It's hard to say  
5 how much water it is. I made a rough estimate of 50  
6 gallons per minute for the total of the whole area. And  
7 that's just a rough estimate. But it is an appreciable  
8 amount of water that's spilling out of the base of the  
9 Blackhawk into the top of the Star Point; and then where  
10 it hits shales, it's spilling out to the surface.

11 Now, if there was faults right in this area (indi-  
12 cating), some of this water would go down the faults  
13 lower down. There is a fault right to the right, or east  
14 here, which does not show on the photo.

15 If I could have the next one, please?

16 MS. NIELSON: That photo will be 15, and the  
17 next one 16.

18 MR. LEAMASTER: (Indicating)

19 MR. MONTGOMERY: Already you've been introduced  
20 to the hydrograph here of the flows of the Big Bear  
21 Spring over the years. I've added a few years onto this  
22 graph that was prepared earlier. But that's compared  
23 with the snow-water equivalent, the average snow-water  
24 equivalent by this purple line. You can see that the  
25 highs in the flows from this spring and the actual water

1 from snow melt, there's about a three-month lag or delay  
2 between those peaks. Now, that's for these earlier years.  
3 Once you get down to about 1987 to the present, you'll  
4 notice the peak has dropped off. And it's true, as is  
5 pointed out by this graph, this is the precipitation here  
6 (indicating). After you get to '87, it dropped down to --  
7 it flattened out here. But notice that the hump pretty  
8 much has been removed. These lower lines here represent  
9 from that 1987 to 1990. And so you can see that the --  
10 besides the impact of the lower precipitation on the  
11 area, there still appears to be an additional impact  
12 occurring to the spring.

13 The next one, please?

14 MR. LEAMASTER: (Indicating)

15 MR. MONTGOMERY: This is the Birch Spring, and  
16 they only have a short record on those. There's, unfor-  
17 tunately, '89 and '90. But this shows what was pointed  
18 out earlier by the president of the District; that this  
19 has been the flow just under a hundred (indicating) --  
20 between 50 and 100 gallons a minute. And then in October  
21 of 1989, this thing jumped up -- clear up 230 gallons a  
22 minute and held up at that flow clear through January.  
23 If you can look at this like a cycle, then the next  
24 year's flow is this different symbol here (indicating) --  
25 turning in here (indicating). And then it just goes

1 right back off like it had been heretofore. Very abnor-  
2 mal situation.

3 Let's see. There's that -- There's one more, Tie  
4 Fork Spring, please.

5 MR. LEAMASTER: (Indicating)

6 MS. NIELSON: Okay. And we'll refer to the  
7 Birch Spring graph as Exhibit 17 and Tie Fork as 18.

8 MR. MONTGOMERY: Okay. Here's the Tie Fork  
9 Spring. And there is mining going on just north of the  
10 Tie Fork Spring beyond the Co-Op Mine. And these curves  
11 tend to parallel each other from '83 to '89, except this  
12 one in 1988. There was a high jump in it, and then it  
13 dropped back down again. And I think that's probably  
14 influenced by mining operations to the north. And the  
15 reason I put this on here is I would like to emphasize  
16 that everything in the area, especially within that  
17 graben, has an influence on the recharge to the Birch  
18 Spring and the Big Bear Spring.

19 The coal mining operations to the north also have an  
20 effect. And any water that they pull out in their opera-  
21 tions, which has been reported by Danielson--that they're  
22 pulling some water out and putting into Cedar Creek back  
23 to the east -- it flows away from the ground water system  
24 and cannot get back into it. And, therefore, it sub-  
25 tracts from the recharge to those springs to the south

1 and has partial impact on them as does the Co-Op Mining  
2 operation.

3 I think -- And I'd just like to conclude for you  
4 that my study has shown that both the Trail Canyon Mine  
5 and the Bear Canyon Mine have impacted both of these  
6 springs. I think the impact to the Big Bear Spring is  
7 less than it is to the Birch Spring, and it is hard to  
8 quantify, especially with the lack of data back during  
9 the years when they were not mining and because of the  
10 drought that's occurred since '77. But that's my con-  
11 clusion: that there has been an impact and -- but it is  
12 difficult to quantify. Thank you.

13 Perhaps later on, if there are questions, I'd be  
14 glad to try to answer them.

15 MS. NIELSON: Mr. Montgomery, could I clarify?

16 MR. MONTGOMERY: Yes.

17 MS. NIELSON: You indicated there will be a  
18 copy of this Report for the Division. Is there also a  
19 copy for Co-Op Mine, or could one be made? It would be  
20 helpful to them.

21 MR. MONTGOMERY: It would be up to these  
22 Districts. I don't know why they wouldn't want to supply  
23 a copy to them, and certainly a copy could be made, as  
24 far as I'm concerned -- made available to them.

25 MS. NIELSON: Okay. I would ask that the

1 counsel for Castle Valley and the other service districts  
2 make that report available to Co-Op Mine.

3 MR. LEAMASTER: Yes, sir.

4 MS. NIELSON: Thank you.

5 (Whereupon, an off-the-record  
6 discussion was had.)

7 MR. JOHANSEN: My name is Scott Johansen. I'm  
8 the City Attorney for Huntington. And I just want to  
9 briefly present the Council and Mayor from Huntington  
10 City. They have asked me to appear and underscore some  
11 of what we think are the major issues here.

12 The first one is that it is important to us in the  
13 City that we be able, in this area, to develop our  
14 mineral resources. And if there is a way to do that, we  
15 don't wish to discourage that. It's good for our economy.  
16 This County depends upon the coal being mined. And if  
17 there is any way to accomplish that, we wish to accommo-  
18 date it.

19 There is one concern which overrides the development  
20 of our natural resources by far, and that is the preser-  
21 vation of our culinary water supply. And that is so very  
22 important to all of us here. And if the choice had to be  
23 made between protecting the culinary water supply for  
24 some four thousand people out of eleven thousand that  
25 reside in the County, that we would have to opt in favor

1 of discontinuing the development of the mineral resources  
2 and preserve the water supply.

3 The purpose of the mining acts, and particularly  
4 Section 40-10-2, states that we are to assure that there  
5 is no mining where reclamation is not feasible. And based  
6 upon the data that you have been presented tonight, we  
7 are very concerned that further mining in this area by  
8 the Co-Op Mine would be of such irreparable effect to  
9 both of the two springs involved, that reclamation would  
10 not be feasible, and we would not be able to withstand  
11 the impact of that continued mining activity.

12 If that destruction of our culinary water source  
13 cannot be replaced, if it cannot be mitigated, then the  
14 survival of Huntington City and, indeed, of Cleveland and  
15 Elmo and also the North Emery Water User customers --  
16 which is the entire north end of Emery County -- is at  
17 stake. And we believe this is a very serious health,  
18 safety and welfare issue which should be addressed by the  
19 Division.

20 The second point that the Mayor has asked me to  
21 underscore is that the potential legal liability to the  
22 Co-Op Mining people is just tremendous. If these poten-  
23 tial effects are not considered and dealt with upon the  
24 front end of any resource development, the possibility of  
25 liability to downstream users and the legal liability and

1 damages that would flow from that are just phenomenal.  
2 And it's somewhat amazing to me that these potential  
3 liabilities have not been dealt with in a more thorough  
4 way in the mine plan application.

5 We might take a less activist view of this mine  
6 application, if the application were not set against the  
7 backdrop of the Co-Op Mine's history of noncompliance in  
8 the past. And that's the third point I wish to empha-  
9 size. From a standpoint of the State Engineer, from the  
10 standpoint of the Forest Service, from the standpoint of  
11 Division of Oil, Gas and Mining, County zoning; almost  
12 every regulatory agency which Co-Op has dealt with over  
13 the past, has a long history of disinclination on the  
14 part of the Co-Op to be very seriously interested in  
15 compliance. And I would refer, as a basis for that, to  
16 the public records that are already on file with the  
17 Division.

18 Based on that, the City has asked me to request some  
19 eight points of relief, which correspond somewhat to the  
20 letter which was written by the Service District. And  
21 those relief -- these items of relief which I'm about to  
22 mention, I believe are all authorized by Section 40-10-6  
23 of the Utah Code.

24 The first one is that we would request that the  
25 Division not renew the mine plan with respect to the

1 ongoing operations until the Co-Op Mine does be compli-  
2 ant, which it should have been doing all along with  
3 respect to monitoring water flow and complying with the  
4 other requirements of the Division. That corresponds  
5 with Item Number 6 in the Service District's letter to  
6 the Division.

7       Secondly, we are requesting that the revision of the  
8 mine plan to add a new area to the north be denied  
9 altogether. It is apparent, from a hydrological study,  
10 that any mining further to the north could have disas-  
11 trous effect on our water table as it intersects the  
12 water plane. That corresponds to Item Number 2 in the  
13 Service District's letter.

14       Thirdly, we are asking that if the mine plan is  
15 reauthorized, or if the revision is authorized to add the  
16 new area to the north, that the Division require the Co-  
17 Op to engage in adequate testing and monitoring of the  
18 water situation at the Co-Op's expense; and that that  
19 request apply, even if operations cease. It is apparent  
20 from the Birch Spring flow data that even after the Co-Op  
21 ceased operation on the Trail Canyon side, that their  
22 mining operations had significant effect on the Birch  
23 Spring.

24       Fourth, we would ask that Huntington City be copied  
25 on all water flow data and other water data that is

1 supplied to the Division from the Co-Op Mine.

2 Fifth, we believe that it is essential to under-  
3 standing of water flow in this area, in this graben, that  
4 the Co-Op be required to drill test holes north of the  
5 proposed mine site so that we can monitor the water flow  
6 through the earth north of where the mine area is. That  
7 corresponds to Item Number 6 in the Service District's  
8 letter.

9 Number six, we are requesting that any water which  
10 is intersected -- intercepted in the mine area be piped  
11 down to where it can be put back into the City's system,  
12 which is most likely the Big Bear Canyon Spring area.  
13 That corresponds with Number 1 in the Service District's  
14 letter.

15 Seventh, we are asking that under Section 10-8-14 of  
16 the Utah Code, that the Division require the Co-Op to  
17 bond for any potential loss of water that -- or provide  
18 other sufficient surety for any potential loss of water  
19 either to North Emery or to the towns of Cleveland and  
20 Elmo or to the city of Huntington.

21 And, lastly, we are asking that any permit that the  
22 Division does see fit to grant, would be limited to five  
23 years under Section 40-10-9, because of the serious,  
24 serious potential effects of the interruption of the  
25 water supply; that no extensions beyond the five-year

1 period be granted.

2 The only other request I would make is that the City  
3 be granted an extra few days, after the conclusion of  
4 this hearing, to submit a written response to what occurs  
5 here. And with that, I would -- with your permission --  
6 I would turn the time over to Jeff Appel, who represents  
7 North Emery Water Users.

8 MR. APPEL: Thank you. My name is Jeffery  
9 Appel. And as Mr. Johansen indicated, I represent the  
10 North Emery Water Users' Association. As an initial  
11 issue, I'm somewhat concerned about the burden of proof.  
12 I understand we're proceeding first. I think there's  
13 probably a two-prong focus here with respect to that  
14 burden of proof under your own rules, I believe.

15 The revision area -- the new areas, the Applicant  
16 would bear the burden of proof. I understand that the  
17 rules may indicate that we would bear the burden of proof  
18 on the existing area. Whereas, due to some of the past  
19 problems and the noncompliance with respect to the par-  
20 ticular permit, I'm not so sure that should be the case.  
21 And I'll get into those right now.

22 These are all in your files. I've been through  
23 portions of them -- not all of them. But as recently as  
24 November 27, 1990, there's a permit deficiency letter in  
25 there in which the Co-Op is cited for 18 violations. And

1 I won't bother to enumerate those. You're all familiar  
2 with them. But many of them were water related. One of  
3 the most important, based upon Mr. Montgomery's testi-  
4 mony, was that we were required to restore the natural  
5 drainage pattern. Well, the natural drainage pattern  
6 isn't what it used to be, and they've done nothing that  
7 we can see to restore it. And we suffered some signifi-  
8 cant problems as a result of that failure.

9 I think Mr. Montgomery's testimony is quite clear on  
10 that. There's a connection between those activities and  
11 -- more clearly with the Birch Spring -- and I believe  
12 his opinion is that it also effects the Bear Canyon  
13 Spring. Those problems have to be dealt with, as these  
14 are culinary water supplies for a number of people down  
15 here; in fact, most of the people down here (indicating).

16 Some of the other problems that are recited in your  
17 files were Co-Op's failure to maintain proper diversions,  
18 culverts and sediment ponds; to install environmental  
19 control, measures; to avoid plugging of erosion inlets  
20 and outlets; to properly monitor surface and ground water  
21 sources; to maintain diversion ditches; to pass disturbed  
22 surface drainage to a treatment facility before release;  
23 to create and submit current maps of sufficient details  
24 to determine if Co-Op is abiding by the state and federal  
25 regulations for protection of water.

1           Now, this gets back to the burden of proof problem.  
2 I can understand the staying of burden of proof on some-  
3 one or giving them that benefit if they had been comply-  
4 ing. These people have been out of compliance, from what  
5 I can tell of the file, nearly the whole time that they  
6 have been in operation. And we've had a significant event  
7 at Birch Springs that our expert indicates is a direct  
8 result of the mine activities and their failure to comply  
9 with their drainage plan.

10           Now, it's interesting. I have some quotations from  
11 that plan, and I won't belabor this, either. But this is  
12 what they said in Section 3.5.3.1: "No significant  
13 impacts to the ground water system are expected from  
14 mining operations. The ground water monitoring plan  
15 discussed in Chapter 7 will provide a means to follow the  
16 possible effect of the mining activities on the ground  
17 water system." Further on, "If necessary, mechanical  
18 devices will be installed to remove grease and oil that  
19 might be present in the water before it is used for dust  
20 suppression." Further on, "In the unlikely event that  
21 mining adversely effects a water source, Co-Op will  
22 select an alternative, after considering all possibili-  
23 ties of each specific circumstance."

24           Well, that's interesting, because the people who  
25 caught the event were my clients. There have been a

1 total of two monitoring reports submitted on Birch  
2 Spring. I'm not sure quite what has happened on Bear  
3 Spring, although I'll be happy to put that together in my  
4 supplementation, or perhaps Mr. Johansen will do that.

5 But the testimony shows that the problem evented in  
6 Birch Spring was mine caused. And I don't think it's a  
7 question of if the injury may occur to these people; it's  
8 a matter of when. And we're lucky that something signif-  
9 icant hasn't happened to date.

10 We concur with the requests that Mr. Johansen has  
11 set forth previously, and I won't belabor those. But I  
12 will make the following statements: I think that they  
13 should have to meet, for once, the specific requirements  
14 for this entire area, including the effect in the adja-  
15 cent area. And this is with respect to both the new  
16 areas and the old areas; the old area being that for  
17 which they're asking for renewal. I think the initial  
18 permit was granted without adequate description of pre-  
19 mining hydrologic resources. For instance, the Birch  
20 Spring was not shown on some of the maps. They didn't  
21 deal with it. The record is fairly ripe with omissions  
22 in that regard. And we need to go back and figure out  
23 what they should have been doing with respect to the  
24 initial permit and then move forward, if we move forward.

25 So, we'd request that the permit be suspended, or

1 the renewal stayed and the permit not granted, until a  
2 thorough inventory is done by the numbers; meaning in  
3 accordance with the complete Code, before any renewal or  
4 addition to the permit is had. We also think that we  
5 have a need for immediate intensive monitoring, at Co-  
6 Op's expense, of all water sources and hydrologic  
7 resources to prevent something horrible happening that  
8 could effect all these people in this valley. We could  
9 have another event at any time. And I think it would be  
10 prudent for them to begin looking immediately for alter-  
11 native sources or some means to protect the existing  
12 sources, whether it's treatment or otherwise. I under-  
13 stand that's contemplated within the studies, but we need  
14 to start now before something horrible happens.

15       You've heard the problems that were quite well arti-  
16 culated by Mr. Montgomery and the people who represent  
17 the companies as their officers. There are also numerous  
18 violations on behalf of Co-Op. I don't think that this  
19 initial permit should have occurred in the fashion it  
20 has. We have the opportunity now to rectify that. I  
21 think we should take that opportunity at this particular  
22 point in time. We need to gather further data and ensure  
23 that some sort of tragic event really doesn't occur.

24       Now, once again, they have the right to mine, I  
25 think, under the regulations, if they take care of these

1 particular sources; being sure if they -- They can con-  
2 tinue to mine if they provide for alternative sources.  
3 We don't have any firm grasp -- I don't think anybody has  
4 a firm grasp of what is really going to happen up there  
5 if mining continues, except if they were to stop right  
6 now, there could be further problems with the springs,  
7 based upon what Mr. Montgomery has told us tonight.

8 And I, too, would ask for ten days from today to  
9 supplement my testimony in writing, at which time I'll  
10 provide further details. Thank you.

11 MS. NIELSON: Thank you. Did you have anything  
12 else to say, Mr. Leamaster?

13 MR. LEAMASTER: No. One thought I failed to  
14 mention, Big Bear Spring was the first t--

15 MS. NIELSON: Could you maybe step up to the  
16 microphone?

17 MR. LEAMASTER: This maybe isn't too signifi-  
18 cant, but I think I wanted to express the importance of  
19 Big Bear Spring again. Big Bear Spring was the first  
20 spring that was ever developed as a water source for  
21 Huntington City. And we have not been able to exactly  
22 pinpoint the date that it was first used, but we found  
23 some maps from UDOT that showed water lines in that area  
24 as early as 1920. We know for sure that it was in their  
25 system as early as 1930. So for at least 60 years, that

1 has been the main source of water for Huntington City.  
2 And as I mentioned, in the last four or five years we've  
3 also put Cleveland and Elmo on that spring source.

4 MS. NIELSON: Thank you.

5 MR. LEAMASTER: That's all we have.

6 MS. NIELSON: All right. I suggest we take a  
7 15-minute break and resume at 8:15. Thank you.

8 (Whereupon, a short recess was  
9 taken.)

10 MS. NIELSON: We'll go back on the record. Mr.  
11 Leamaster?

12 MR. LEAMASTER: Could I just let him --

13 MS. NIELSON: Excuse me.

14 MR. MONTGOMERY: Bryce Montgomery. I just  
15 wanted to emphasize that in the cross section I presented  
16 and in the report, the main concern is expressed relative  
17 to the upper coal seam that's being currently mined in  
18 the Bear Canyon Mine -- the Bear Canyon coal seam. And  
19 my remarks with regard to what may happen as that seam is  
20 extended further north under the proposed permit area,  
21 that seam is somewhat higher than the Hiawatha coal seam.  
22 And the permit, as I understand it -- the new permit is  
23 requesting not only the right to mine that seam, but also  
24 to go back down and mine on the Hiawatha seam. Since that  
25 seam is at a lower elevation, as they extend it up-dip

1 northward, it will intersect the potentiometric surface  
2 of the Blackhawk-Star Point aquifer much more sooner --  
3 quicker than would the upper seam mining. I just wanted  
4 to emphasize that. So the impact would be much greater.

5 MS. NIELSON: Okay. Is that clear in the  
6 report?

7 MR. MONTGOMERY: I think the report emphasizes  
8 the upper seam. That's why I wanted to emphasize this  
9 now, so that -- because the understanding I had at the  
10 time I made the report was it was more directed toward  
11 the extension of the present mining; the mining of the  
12 upper seam of Bear Canyon, rather than going down and  
13 picking up this Hiawatha seam. But I understand that the  
14 permit is requesting both, so I wanted to emphasize that.

15 MS. NIELSON: Thank you. The Division recog-  
16 nizes that we've received a report dated January 28, 1991  
17 to Mr. Darrel V. Leamaster and Mr. Menco Coppinga from S.  
18 Bryce Montgomery entitled "Hydrologic investigation and  
19 report of Big Bear Spring and Birch Spring relative to  
20 Co-Op Mining Company, past, present and proposed coal  
21 mining, Township 15-16 South, Range 7 East, Salt Lake  
22 Base & Meridian, Emery County, Utah." We will receive  
23 that as Exhibit 19, recognizing that the exhibits which  
24 Mr. Montgomery presented in his testimony are included  
25 within this report.

1           Mrs. Wilson, did you wish to make any comments on  
2 behalf of Huntington-Cleveland Irrigation Company?

3           MRS. WILSON: Yes. I have just a statement I  
4 can leave, or do you want me to read it?

5           MS. NIELSON: Whichever you would prefer.

6           MRS. WILSON: Okay. He's got -- made a state-  
7 ment. He wasn't able to be here tonight.

8           MS. NIELSON: Would you identify yourself for  
9 the record, please?

10           MRS. WILSON: I'm Lucille Wilson. I'm Ardeth  
11 Wilson's wife. He's unable to be here tonight. And I'm  
12 representing Huntington-Cleveland Irrigation Company for  
13 him. He made a statement that he said I could just read,  
14 and it says, "The Huntington-Cleveland Irrigation Company  
15 is concerned about the mining operations of the Co-Op  
16 Mine. Water intercepted by the mining operations, taken  
17 inside the mine, is taking water from the streams and  
18 springs in the mountain top. Huntington-Cleveland  
19 Irrigation Company has the first water filings in the  
20 Huntington Creek Drainage. Water intercepted by the Co-  
21 Op Mine's mining process is taking water that is covered  
22 under the Huntington-Cleveland Irrigation Company fil-  
23 ings. The Board of Directors of the Huntington-Cleveland  
24 Irrigation Company want to go on file this 5th day of  
25 February, 1991, showing our concerns about the mining

1 operation at the Co-Op Mine, and the monitoring and  
2 measuring of this water."

3 MS. NIELSON: Thank you. We'll accept this  
4 letter dated February 5, 1991 as Exhibit 20. Are there  
5 any other comments that North Emery Water Users' Associa-  
6 tion want to make?

7 All right. At this time I would like to ask Co-Op  
8 Mining if they would like to present their case and make  
9 any comments. And would you step to the podium and state  
10 your name and affiliation again for the record?

11 MR. OWEN: I'm Wendell Owen with the Co-Op  
12 Mining Company. As far as any technical information or  
13 technical data, I'm going to leave that to our consul-  
14 tant, Mr. Kim Mangum. Of course, any legal answers or  
15 legal questions we'll leave up to our attorney, Carl  
16 Kingston.

17 The main thing I want to do is say that we are also  
18 concerned about the water in the area. We have tried in  
19 the past to cooperate. We do presently have an agreement  
20 with Huntington City in regards to the spring. And I  
21 believe that agreement is a matter of record in the per-  
22 mit also. That agreement was reached here a number of  
23 years ago, I think when we first went into the area.

24 SPECTATOR: 1976, Wendell.

25 MR. OWEN: Yes, uh-huh -- and is still in

1 effect. And there were certain limitations as to what  
2 would trigger the agreement -- the terms of the agree-  
3 ment. And those limitations have never been breached.  
4 In other words, there has not been a sudden drop to the  
5 extent that would trigger the conditions of that agree-  
6 ment.

7 And like I say, we want to continue to cooperate.  
8 We are concerned. We want to take whatever measures we  
9 need to to ensure the water supply of the people of Emery  
10 County. We feel like there can be measures taken and  
11 agreements, or whatever, made that can ensure that water  
12 supply for the people of the County, and at the same time  
13 allow us to continue mining, which, of course, we are  
14 very anxious to do.

15 Now, like I say, I'm going to leave most of the  
16 technical part of it to these other people. But a couple  
17 of questions I would -- or a couple of answers I would  
18 like to give, or remarks, to some of the things that were  
19 brought out.

20 There's been several references to our water moni-  
21 toring and to our lack of compliance. We do monitor the  
22 water. That has been one of the requirements of the  
23 Division of Oil, Gas & Mining. We keep those monitoring  
24 records. We make them available to the Division and to  
25 their representatives when they come on-site. As far as

1     Huntington Spring, we have not had access, since they  
2     keep it locked to the spring itself. As far as water  
3     quality, we have monitored the overflow. There is always  
4     a little bit overflows that I guess we're catching there.  
5     I wouldn't say an "overflow;" probably from small rivu-  
6     lets that come at different places in that area. We have  
7     monitored the quality in those places. As far as the  
8     quantity, I was of the understanding of our previous  
9     agreement that they were going to monitor the quantity  
10    and send us the information, which they have. Annually  
11    they've sent us the quantity and monitored all the  
12    springs, so we didn't feel like we were failing in our  
13    monitoring, as far as the monitoring of the spring or of  
14    the other water in the areas.

15         Now, in regards to the showing of ice on the ledges,  
16    as long as I can remember there has been seepage indica-  
17    tion in the summertime and ice in the wintertime. Now,  
18    I'm not enough of an expert or hydrologist to try to  
19    determine how much there is or as to what extent the  
20    problem is.

21         Incidentally, I have, in walking farther up Bear  
22    Canyon to the north, noticed there are similar accumula-  
23    tions of ice on the ledges to the east; the side that we  
24    are not mining. So apparently, it is not necessarily a  
25    peculiarity of that particular area of a mining -- part

1 of a mining operation.

2 Now, one other thing that I would like to bring to  
3 the attention of this Division: like I say, we have tried  
4 to cooperate. Any who have requested returning to the  
5 mine, we have taken them and tried to do all we can  
6 there.

7 Now, Mr. Montgomery did make a tour through our  
8 mine. In his statement he mentioned that water was prob-  
9 ably traveling down through the fault zones into the  
10 lower strata to reach the spring. And I can understand  
11 now why he's -- one of his main interests in making that  
12 tour through the mine was to visit the faulted areas. He  
13 told me he crossed the fault in the mine -- which we did  
14 in our tour -- both of those areas that he requested that  
15 we go to. And at those places, we found little or no  
16 water in any of those fault areas that we visited.

17 Now, we do -- in mining operations, we do, as we  
18 mine, encounter a certain amount of water. It's fairly  
19 normal. Any mine I've been in does it. It dries up  
20 behind us. It's not always encountered -- a little water.  
21 Some places more than others. As was pointed out by Mr.  
22 Montgomery, as you're in there -- as you get in your  
23 various dips and rolls in the seams there -- and, of  
24 course, it will drift down into the bottom of the row.  
25 And at that point, why, the water will drip out faster.

1 And in -- At those points, why, usually there's no water  
2 standing on the row.

3 But aside from that, I cannot see that we have done  
4 anything any different in our mining operation than we  
5 have always done. And I don't know that there has been  
6 any appreciable change in anything in the way of un-  
7 accounting that brings to my mind.

8 So, like I say, aside from that, I'll leave the  
9 technical part of it to Mr. Mangum. I would like to  
10 express again that we do want to work with these water  
11 agencies. We want to do everything that we can to  
12 cooperate and to make them feel they are not in danger.  
13 But we do feel like we can mine coal and continue to mine  
14 coal without depriving Emery County of their water.  
15 Thank you.

16 Would it be all right, then, if Mr. Mangum --

17 MS. NIELSON: Please. And would you identify  
18 yourself for the record?

19 MR. MANGUM: My name is Kimberly C. Mangum.  
20 I'm a registered professional engineer in the State of  
21 Utah -- civil engineer. I'm a consultant for Co-Op Mining  
22 Company. I have been working for them for the last few  
23 years. I appreciate some information that's been brought  
24 forth this evening and Mr. Montgomery's expertise. How-  
25 ever, much of the information which has been brought out

1 is new to us and needs to be addressed specifically. So,  
2 we reserve a request of that opportunity to review the  
3 report and some of the other information which has been  
4 brought forth, as well as any written information which  
5 is introduced in the next few days. We request an oppor-  
6 tunity to review that and deal with each item on as  
7 specific basis.

8 In regards to some of the information which was  
9 brought forth, I have here a graph which was sent to me  
10 by Mr. --

11 THE REPORTER: Can you speak up a little bit?  
12 It's a little bit hard to hear you?

13 MS. NIELSON: Maybe you can turn the microphone  
14 up just a little bit more.

15 MR. MANGUM: (Indicating)

16 MS. NIELSON: That will help.

17 MR. MANGUM: I have a graph here that was sent  
18 to me by Mr. Leamaster, where he had plotted the flow of  
19 Big Bear Springs and shown -- shows the precipitation  
20 also on the same graph. Also, there is -- There is also  
21 a line which shows the flow of Little Bear Springs, which  
22 is outside of what was referred to as a graben area by  
23 Mr. Montgomery. We feel that they could quite correctly  
24 follow the precipitation that is given on the graph. If  
25 you cannot see it from here, it is a green line that

1 flows -- starts here during the high rain period, which  
2 we are all aware we had and --

3 MS. NIELSON: Can we ask you, maybe, to hold it  
4 up to show it a little bit so we can see all of it?

5 MR. MANGUM: That's okay. We're not dealing  
6 with the exact numbers; just curves here. As you can see  
7 here (indicating), this is Tie Fork Spring along the  
8 bottom. This particular increase in flow was pointed out  
9 by Mr. Montgomery. It occurred in late 1988, which is  
10 approximately one year from when the increase in flow  
11 occurred at Birch Spring. The explanation which Mr.  
12 Montgomery gave was that it would be related, or possibly  
13 related, to mining activity to the north. But there is  
14 a time period between events that occur to the north and  
15 what would occur to the south. And there's a possibility  
16 of a connection with these two events of Tie Fork and at  
17 Birch Spring in increase in flow.

18 There is also an increase in flow on the Little Bear  
19 Spring at approximately the same time as the increase in  
20 flow at Birch Spring. There is no geological connection,  
21 according to what Mr. Montgomery showed us. They are not  
22 in the same graben or fault valley.

23 MS. NIELSON: Could you clarify the time frame  
24 of that increase, if you could read off the graph itself?

25 MR. MANGUM: It occurred September-October --

1 September-October of 1989, which is the same time period  
2 as the increase in flow in Birch Spring.

3 MS. NIELSON: Thank you.

4 MR. MANGUM: Also, I'm sure, because of space  
5 on the graph -- but if we look at the one behind here --  
6 Can you drop that one down? The precipitation comes down  
7 -- It shows the flow rate back until 1982. All of the  
8 graphs that were shown previously do not go back that  
9 far. If you notice, the rainfall crosses at different  
10 points as it crossed in latter years during the drought.  
11 One of the key points -- thank you -- that I would like  
12 to state was it is very likely and most probable, in my  
13 opinion, is that the event which instigated this hearing  
14 was -- is the low flow.

15 And we are all aware of the correlation -- the dir-  
16 ect correlation we have with precipitation. And that is  
17 quite clear. Mr. Montgomery, in his -- when he was up  
18 here, said that he felt there was a connection also with  
19 mining. He said, according to the graph, that -- where  
20 he said there were no more increases during the years, he  
21 said that he felt that would be attributable to mining  
22 activity. He did not show a direct correlation of why  
23 that would be attributable to mining activity; an aquifer  
24 lower to the fault zone. It is not an aquifer, as he  
25 also stated. Water would, at a low flow, would not have

1 the same direct increases as it does during a higher flow  
2 year. The flow from a spring would be more level in low  
3 precipitation years because of the lag of the water  
4 before it gets into the spring.

5 So, I don't feel that there is an attributable cor-  
6 relation that can be shown there.

7 MS. NIELSON: Mr. Mangum, could I clarify? Are  
8 these exhibits equivalent to the ones that were shown  
9 earlier by Mr. Montgomery, or do you have additional  
10 copies of those that we could include for the record?

11 MR. MANGUM: We will have to make copies of  
12 those. I received that information directly from Mr. --  
13 from Darrel Leamaster. So, that information would be the  
14 same, unless he has changed in between -- the same infor-  
15 mation. But it includes more -- additional information  
16 from what was presented in his; specifically, the Little  
17 Bear and other things.

18 MS. NIELSON: Okay. If you could provide  
19 copies of those, and we'll designate them as Exhibits A  
20 and B.

21 MR. LEAMASTER: Maybe I could clarify. The  
22 exhibits I had were the same information. Those are long-  
23 time period and are basically the same information. I  
24 just presented them a little differently.

25 MS. NIELSON: Okay. We recognize they're

1 similar. If it is possible to provide us with copies, I  
2 would appreciate it. And we'll designate those Exhibits  
3 A and B.

4 MR. MANGUM: That would be fine.

5 MS. NIELSON: Thank you.

6 MR. MANGUM: There has been much talk about the  
7 effect of mining on the water. The water that is inter-  
8 cepted in the mine has--is left almost exclusively within  
9 the mine. Where it goes in, it is taken into sumps. It  
10 does not disappear. It's not evaporated into the area.  
11 It stays in the ground. The mine is above the line, which  
12 is referred to as the aquifer, which would be the top of  
13 that bed in which the water flows. And there is no reason  
14 to believe that because that water is -- must stay in the  
15 mine, that it is really not entering into that same bed.

16 As far as the contamination which was purportedly  
17 done to Birch Spring, the -- When the increase in flow  
18 occurred, there was seep-out from the canyon. And that  
19 water flowed over and into the inlet where the water was  
20 taken from. There are -- There were deer droppings, there  
21 were birds on the hills. And that coliform increase  
22 would -- is easily directed or could be blamed on that  
23 surface source. It is also noted in -- during inspec-  
24 tions when this testing was done, that the lock or the  
25 hinges on the box where the water went in has been oiled.

1 And that oil and grease which appeared in some samples  
2 could have easily have come from there.

3 The alternative is that the oil and grease was car-  
4 ried through the aquifer out the ledges and back down in.  
5 That oil and grease would be expected to continue, if  
6 that was the case. Where it went in and came off from  
7 the hinges, it was because the flow at that point was  
8 reaching the hinges. And as it typically reached the  
9 hinges, it was during the normal flow period.

10 There's also -- It was stated that testing on Big  
11 Bear Spring was done for coliform, I think monthly, for  
12 organic-inorganic matters. It was stated that it was  
13 done once a year or up to every three years. So, we  
14 would need baseline data in order to establish any real-  
15 istic increases in those values.

16 It was stated a few times of noncompliance and a  
17 history of noncompliance with Co-Op Mining Company. My  
18 experience with Co-Op Mining Company has been that they  
19 are willing to comply; that they have rapidly complied  
20 with all requirements that have been given to them. As  
21 far as water monitoring data, it was stated that was done  
22 improperly or it hasn't been done routinely. There is a  
23 recent history that I'm aware of that it has been done  
24 routinely. Monitoring of Birch Spring has typically been  
25 dry. That is on record. It was measured quarterly when

1 it was not dry; that samples were taken, and the parame-  
2 ters that were dictated by the mine plan were tested.

3 And as Mr. Owen stated, overflow from Big Bear -- I  
4 mean from Big Bear Spring is also routinely monitored.  
5 A base line was taken and is now monitored quarterly.

6 One other statement that I -- At this point I would  
7 like to draw to the attention of the Hearing Board that  
8 in November 12, 1990, Ardeth Wilson, secretary of  
9 Huntington-Cleveland Irrigation Company, withdrew his  
10 formal protest.

11 I feel like all these problems can be resolved; that  
12 the -- and I understand the Co-Op is willing to deal with  
13 these entities to resolve them. I again state that we  
14 would like to review, on a point by point basis, some of  
15 the points that are made in the report and in the  
16 requests that have been made.

17 That's all I have to say.

18 MR. STODDARD: My name is Bill Stoddard, and  
19 I'm president of the Co-Op Mining Company. And my con-  
20 cern would be at this time to let everybody know of the  
21 Division and everybody here that we do want to cooperate,  
22 and that our concern is the same as your concern. We  
23 don't want to pollute the water or tap into it in any way  
24 so that it isn't made available. So I just want to make  
25 mention that that would be my concern and our concern:

1 to be able to cooperate and let you know that our con-  
2 cerns are the same.

3 One other item that I would like to make mention:  
4 that it was made mentioned that we -- One of the things  
5 that Mr. Johansen brought up was any extension in our  
6 mining area should be denied because we might run into  
7 that water. It's also been made mention that there are  
8 mines north of us, so I don't feel that that impact would  
9 be -- because of that, that our impact would be that much  
10 on mining farther north.

11 And, thirdly, on behalf of the Co-Op Mine, I would  
12 like to ask maybe the Division permission that we might  
13 be able to meet with each of these concerns -- meet with  
14 them and talk with them and see if we can't work these  
15 things out and come to an agreement so that we can work  
16 with you and they can work with us and come up with an  
17 agreement. I would like to ask that we might be given  
18 permission for that time period. That's all I have to  
19 say.

20 MS. NIELSON: Mr. Kingston, did you want to  
21 make a comment?

22 MR. KINGSTON: If I might.

23 MS. NIELSON: Could you identify yourself for  
24 the record?

25 MR. KINGSTON: Carl Kingston, attorney for

1 Co-Op Mining Company. Each one of these items that were  
2 raised, I think we could spend probably a half an hour or  
3 forty-five minutes on rebutting. I think the suggestion  
4 of Kimberly Mangum is proper; that we be allowed to add-  
5 ress each one of these in writing, since tonight is the  
6 first time we were apprised of some of these things.

7 But I think it should be evidence from the people  
8 that have spoken that it is the concern of Co-Op Mining  
9 Company to work with these people. We are concerned about  
10 the water rights that exist in the area. In fact, I rep-  
11 resent some of the stockholders in Huntington-Cleveland  
12 Irrigation District, so I'm personally concerned, and I  
13 can represent that each one of the management personnel  
14 at Co-Op Mining Company are also concerned. I think you  
15 do have sufficient information that you can review and  
16 probably evaluate some of the concerns, particularly with  
17 regard to the alleged decrease in the water flow of the  
18 springs that are supposedly directly affected by Co-Op  
19 Mining activity. But if you correlate those and compare  
20 those with springs that are not in this same graben and  
21 aquifer, you'll find that they go along the same exact  
22 parallel line, based upon the precipitation within that  
23 particular time period.

24 Also, I do want to emphasize that the concern about  
25 mining north is really not that legitimate concern,

1 because there is a mine existing to the north. And Co-Op  
2 Mining Company has been mining in Bear Canyon for ten  
3 years now, and they've been mining in Trail Canyon since  
4 before 1940. And I don't believe there is any documented  
5 evidence that exists that can show that during that time  
6 period there's been any adverse effect on anybody's water  
7 rights.

8 Now, certainly that potential exists; and whether  
9 that potential is great, as the objectors have proposed  
10 tonight, or whether that's minimal, as Co-Op Mining's  
11 position will be, that potential does exist, and it ought  
12 to be dealt with, and Co-Op Mining Company is willing to  
13 deal with that.

14 It seems that the answer would be a monitoring pro-  
15 gram. I believe the Co-Op Mining Company had monitored,  
16 pursuant to the requirements of the plan. If there's add-  
17 itional monitoring that needs to be done, I think Co-Op  
18 Mining Company is willing to do that.

19 One of the problems, I think, has been that the area  
20 the objectors propose we do monitor, we can't get to  
21 because of the locked gates. And I suppose that would be  
22 an easy enough problem to resolve; simply by allowing us  
23 access at different times. But another suggestion was  
24 made that we perhaps could work one-on-one with these  
25 people and arrive at some agreement. And that also is

1 something I wouldn't want the Board to foreclose us from  
2 doing.

3 But simply to restate our position, we do want to  
4 have the time to address both the information that we  
5 received for the first time tonight, plus any additional  
6 comments that might be submitted in writing by the oppo-  
7 nents. And we are concerned. We want to work with the  
8 Division. We want to work with the objectors. We want  
9 to continue to mine. We don't want to effect anybody's  
10 water rights. We want to conduct an operation that's  
11 sincerely concerned and addresses the objections that  
12 have been raised. Thank you.

13 MS. NIELSON: I would like to provide now for  
14 an opportunity first to Castle Valley Special Service  
15 District, North Emery Water Users' Association, the  
16 attorney for Huntington City, and the attorney for Castle  
17 Valley. If you have any questions with regard to the  
18 information that's been presented by Co-Op that you want  
19 to address at this point --

20 MR. JOHANSEN: I don't.

21 MR. APPEL: I don't have any questions either.  
22 Thank you.

23 MR. LEAMASTER: I don't have a question, but  
24 there's one point of clarification that I should make on  
25 those graphs.

1 MS. NIELSON: Why don't you do that now, Mr.  
2 Leamaster. And we're referring to graph Exhibits A and  
3 B. And I believe this is Exhibit A (indicating).  
4

5 MR. LEAMASTER: The point I just wanted to  
6 clarify, we talked about these peaks that occurred. They  
7 indicated they were in 1988. They were actually in --  
8 Excuse me. They said they were in 1989, which coincides  
9 with the time they got the peaks of Birch Spring. The  
10 peaks actually occurred in 1988. That's this peak and  
11 this peak (indicating). Now, it may be relevant. We  
12 have thought it was. In August of 1988 there was an  
13 earthquake that occurred just slightly south and east of  
14 us here. It was about a 5.2 or 3; something of that mag-  
15 nitude. We felt that had an effect on those two springs  
16 and increased the flow. The increase in flow that they  
17 saw at Birch Spring was in late 1989 and early '90, so it  
18 was separated by at least a year with these peaks.

19 MS. NIELSON: And was not related to --

20 MR. LEAMASTER: None that I know of.

21 MS. NIELSON: Okay. Thank you.

22 MR. LEAMASTER: He's indicated to me that  
23 there's a peak he was discussing --

24 MS. NIELSON: "He" being Mr. Mangum?

25 MR. LEAMASTER: Mr. Mangum. Was this peak on  
Little Bear Springs that occurred in -- looks like August

1 or September of '89. I'd suggest that is a pretty common  
2 thing that we've had all the way along. Because as you  
3 can see, we peaked in July and August in almost every  
4 year on that spring. So, I don't see this peak occurring  
5 anything different or unusual from what we've had on the  
6 whole history of the spring.  
7

8 MS. NIELSON: For the record, then, does the  
9 Co-Op have any other question they wanted to address at  
10 this point?

11 (Participants indicating nega-  
12 tively.)

13 MS. NIELSON: There are a couple that I would  
14 like to ask for some clarification on. While I appreci-  
15 ate it's somewhat cumbersome, whoever chooses to respond  
16 to these could come to the mike so we can facilitate that  
17 comment.

18 First of all, I'm wondering how much -- and I think  
19 I'm addressing this question to you, Mr. Montgomery, but  
20 if other's want to comment, I'd appreciate that also. Is  
21 it possible, in your study, to be able to distinguish how  
22 much of the impact that you're defining is related to Co-  
23 Op's operation at Bear Canyon as opposed to other mining  
24 or exploration operations that are going on within and  
25 north of the graben you defined?

MR. MONTGOMERY: With the present information

1 that was made available to me, that would be very dif-  
2 ficult to separate out and define; that this mine has  
3 caused this amount of decrease in flow. The problem, and  
4 one of the great needs, is to have a baseline or a moni-  
5 toring well north of the mining operation so that we can  
6 see what's happening to the aquifer before the water gets  
7 to the mine, and then compare those water levels with  
8 changes that occur in the springs. It would have been  
9 ideal to have had this before any mining had taken place.  
10 Even though there were a couple of test wells drilled up  
11 there that I used information from the logs, I was unable  
12 to get access because it was high in the snow when I was  
13 there. But if those have been maintained, I don't know  
14 about it. But, really, there ought to be a monitoring --  
15 at least one; more than one would be preferable -- north  
16 of the proposed mining or existing mining so we can see  
17 what's happening in that aquifer under normal conditions.  
18 And that's really what's needed to better define or ans-  
19 wer your question. But with the present information, as  
20 I have it available, that would be difficult to answer.

21 MS. NIELSON: Okay. You've been underground --  
22 I have one more question.

23 MR. MONTGOMERY: All right.

24 MS. NIELSON: You've been underground in the  
25 Bear Canyon Mine?

1  
2 MR. MONTGOMERY: Yes, right.

3 MS. NIELSON: Can you identify the fractures  
4 that you indicated on your exhibits of the structure  
5 maps; can you identify those structures underground  
6 within the mine?

7 MR. MONTGOMERY: Yes, we can. They're very  
8 pronounced. And the faults that I show on the map, you  
9 can see them underground pretty well. And the coal bed  
10 is offset very conspicuously. There are many joints that  
11 parallel the faults that are hard to identify, because  
12 with no offset on them, and because they do spray the  
13 inside of the mine coated with lime dust, that it's hard  
14 to know where they are, because it's almost like you've  
15 painted over them. That's what's happened. But if water  
16 is working presently to those, and it's obvious there are  
17 places where water is coming down through-- The main flow  
18 I was able to see in the mine is up in the north end. And  
19 that is where the mining company has fenced off the area  
20 and put -- installed a pump. And they're pumping out of  
21 that water yielding area -- I understand from there maps  
22 that over a hundred gallons per minute was reported in  
23 that area. I don't know exactly the quantity of water  
24 they're pumping out of there for dust suppression; part  
25 of which water goes outside of the mine on supply uses  
outside of the mine. There is a pipeline that was pointed

1 out to us coming from the mine, so some of the water is  
2 used out of the mine. But the main flow -- appreciable  
3 flow is coming in the north end from the present mining  
4 operations.

5 And as was pointed out by Wendell, there are other  
6 flows in several other areas, but they are very small.  
7 And I think one of the problems in a mining operation,  
8 some joints, or even faults that's -- before the mining  
9 operations were open and allowed the free movement of  
10 water through them -- Once you instigate mining opera-  
11 tions, you got coal dust; you got other kinds of dust,  
12 debris that tends to plug those in the floor of the mine.  
13 And not that they can't be freed at times, maybe under  
14 higher head of water or some other means, but not all of  
15 the water you see in the mine would necessarily have to  
16 have been recharged to the springs. Some of it may never  
17 have reached the springs. It may have spilled out as  
18 natural seeps, as Wendell pointed out.

19 The concern is that it appears that more is coming  
20 out to the surface than was heretofore. And that amount  
21 of water, part of it would have gotten into the recharge  
22 of the springs below. It's hard to define exactly how  
23 much of it got down. The joints in the sandstone tend to  
24 be sealed off at the shale beds. But along the faults,  
25 water tends to move on through the shale beds and go on

1 down. So, all of the joints do not transmit the water  
2 downward. The shale beds tend to deflect the water, and  
3 it comes to the surface, as was shown. But it's a hard  
4 thing to quantify, and especially once the mine has been  
5 coated inside to see exactly all the openings. But those  
6 faults are very obvious. The joints are hard to tell all  
7 of them, unless water is coming through them.

8 MS. NIELSON: When you were in the mine and you  
9 noticed the hundred gallons per minute close in the north  
10 end --

11 MR. MONTGOMERY: Yes.

12 MS. NIELSON: (Continuing)-- do you recall when  
13 that was?

14 MR. MONTGOMERY: Yes. That was in the first  
15 part of January that we were in the mine.

16 MS. NIELSON: Of '91?

17 MR. MONTGOMERY: Yes, '91. And that's the flow  
18 that they're presently using. It would be well, I think,  
19 for Wendell or one of the people from the mine to say  
20 exactly how much water they're pumping from that source  
21 area. It would be helpful.

22 MS. NIELSON: Mr. Owen?

23 MR. OWEN: We don't know exactly how much we're  
24 pumping from there. We pump from there, as he brought  
25 out, to other places to where we're mining. It takes a

1 certain amount of water. You have to spray the coal as  
2 you mine it; you have to have water on the belts; you  
3 have to have dust control; you have to have dust control  
4 on the surface. The only meter we have is on a line that  
5 leaves the mine to the surface. We have a culinary tank.  
6 And, of course, because of the variation in the use of  
7 bathhouse water and so on, it, at times, overflows. We  
8 have an overflow that is in our mine plan, and that is --  
9 as has been documented by Oil, Gas and Mining.

10 Now, as far as the hundred gallon a minute, when  
11 that water survey was made, I asked the people doing that  
12 how they came up to a hundred gallon per minute. The  
13 reason I was concerned is that water -- I don't know how  
14 many of you -- probably a lot of you around here in this  
15 country are familiar with mines -- and that comes from  
16 maybe a thousand drips in the ceiling. And I don't know  
17 how in the world you'd ever tell that there was a hundred  
18 gallon a minute there. And I pose that question. And  
19 that was that they said, "Well, we come to as close an  
20 estimate as we could," because there's no way to get  
21 enough buckets under each one of those drips to time how  
22 long it will take to fill five gallon a minute. But I  
23 wanted to bring out that the hundred gallon a minute  
24 figure is not really a set, hard and guide figure.  
25

MS. NIELSON: Mr. Owen, if I could ask a

1 question?

2 MR. OWEN: Yes.

3 MS. NIELSON: And if you wanted to put it to  
4 someone else, it's my understanding that right now Co-Op  
5 is pumping water from sumps in the mine for culinary use  
6 outside the mine; is that correct?

7 MR. OWEN: Yes, that's correct.

8 MS. NIELSON: Do you meter that use?

9 MR. OWEN: We meter what has left, yes. There  
10 is a meter where it leaves the mine and goes to the sur-  
11 face.

12 MS. NIELSON: Have there been variations in the  
13 amount of water that has been withdrawn from the mine for  
14 culinary purposes over the period of time that we're dis-  
15 cussing?

16 MR. OWEN: Only, oh, short-term. Like I say,  
17 depending on being-- When we have holiday weeks, we don't  
18 have the bathhouse in use. Just short-term variations.  
19 Some seasons we have to use dust control more than we do  
20 others. Dry seasons we use dust control.

21 MS. NIELSON: But the dust control would be  
22 within the mine, again?

23 MR. OWEN: Dust control on the surface as well.

24 MS. NIELSON: Okay. So the water is used for  
25 culinary purposes after dust control within the mine?

1 MR. OWEN: That's correct. And like I say,  
2 there wouldn't be a lot of variation. It would be minor  
3 variations.

4 MS. NIELSON: How do you define "minor?" What  
5 sort of order of magnitude are we talking about? Is that  
6 less than 10% of the totals of constant variation; less  
7 than 10%, or --

8 MR. OWEN: I would imagine probably less than  
9 10%, uh-huh. Like I say, as far as especially if you  
10 take it over a period of a month. In other words, on a  
11 dry day we're using more water for dust control. You get  
12 a wet spell, and you're not.

13 MS. NIELSON: Is there any other discharge from  
14 the mine?

15 MR. OWEN: Like I say, it -- the culinary has,  
16 at times, overflowed, so that there has been more dis-  
17 charge at times than what has actually been used. We do  
18 have an overflow on the culinary tank. And there is times  
19 that it overflows.

20 MS. NIELSON: But that would have been metered  
21 coming out of the mine before it went into the culinary  
22 tank?

23 MR. OWEN: Yes.

24 MS. NIELSON: Okay. Thank you.

25 MR. OWEN: Is that all?

1 MS. NIELSON: (Indicating affirmatively.)

2 MR. MANGUM: Can I make a comment?

3 MS. NIELSON: Certainly, Mr. Mangum.

4 MR. MANGUM: Yes. Just a comment about putting  
5 a drill hole north of the mine. It has been commented  
6 previously about drill holes, because this is not an  
7 exact aquifer; that the water may flow six feet away from  
8 where you put the hole and not where you put the hole,  
9 and also could disrupt that particular crack that the  
10 water was flowing in. So, there is some concern, even,  
11 about putting in a drill hole in its accuracy or in its  
12 possible disruption of the existing aquifer or crack.

13 MS. NIELSON: I have a question that I think  
14 perhaps, Mr. Leamaster, you can address or tell me who  
15 might be able to address it.

16 I understand that there are concerns about monitor-  
17 ing and the request for monitoring by Co-Op. It's my  
18 understanding that there is an existing monitoring pro-  
19 gram, but that there is not access to boxes that are  
20 locked. Has there been, in the past, some arrangement  
21 for Co-Op to be able to gain access to those to monitor,  
22 or is it possible to work out an arrangement where there  
23 could be monitoring of those locked points?

24 MR. LEAMASTER: Yes. All of our collection  
25 boxes and our spring outlets are locked, obviously to

1 keep any vandals or anyone else out of the springs. I  
2 don't think we have any major objections to making those  
3 available to them for monitoring. To my knowledge,  
4 they've never requested that from us. And I think that  
5 some arrangement could be worked out. I think Mr. Owen  
6 indicated that on our Big Bear Spring they've been sampl-  
7 ing from some of the -- it's not really an overflow. It's  
8 a small trickle that escapes our collection system and  
9 runs by us. And apparently, that's what they've been  
10 sampling there.

11 One of our problems there is we don't feel like  
12 we've ever had access to the information that they have  
13 collected -- you know, whatever they collected. And we  
14 would really like to have some kind of access to that; to  
15 know what's going on and how it's collected and when it's  
16 collected and what the results were.

17 MS. NIELSON: Thank you. Does the Division  
18 have other questions?

19 MR. MUNSON: Mr. Montgomery, when you were in  
20 the mine, I believe we saw, as well as when I was in the  
21 mine -- and where the water occurred in the north part of  
22 the mine -- I was just curious if you could ascertain  
23 that that was fault-related versus potentially a channel  
24 sand, which I don't know if you're familiar with that  
25 occurrence, but that is a very common occurrence in these

1 mining operations where there's been an actual -- a  
2 channel has been laid out you know, past connate water-  
3 type scenario? Would you address that?

4 MR. MONTGOMERY: Certainly. We did not get  
5 beyond the fence. The area is fenced off. And so I  
6 could not look right up close to it, and the water was  
7 deeper there. So we didn't get right up and look at it  
8 closely. From the mapping that I've done, which I might  
9 state verbally, but it's in the report, I utilized two  
10 sets of aerial photography besides what field work I did.  
11 And there is a fault north of there that you can trace  
12 southward; but then it terminates, as far as what you can  
13 see on the surface from aerial photography. And I could  
14 not correlate that spring or the discharge point that  
15 they're getting their water out of with any particular  
16 fault. I can't, from the information I have on hand. It  
17 could easily be coming, as you say, through a channel in  
18 the sandstone. But it's dynamic water. It's moving. It  
19 isn't stagnant, and they are using from it. So, it's  
20 refreshing itself. So, it's being recharged, and I sus-  
21 pect it's being recharged by either faults or prominent  
22 joints. That's the likely recharge to it. But it cer-  
23 tainly could be discharging out of a channel sandstone  
24 that's being fed from fractures.

25 So as far as looking closer than about, oh, probably

1 sixty or seventy feet, something like that, that's the  
2 closest gaze I got at it.  
3

4 MR. MUNSON: Thank you.

5 MR. MITCHELL: This isn't so much a question,  
6 as much as a clarification of where we are right now,  
7 without taking anything away from the chairman. This is  
8 new information, to a large extent. The Co-Op and the  
9 Division would like the opportunity to review, particu-  
10 larly the geologist's report. To that end, I think you  
11 can all understand that this will need to be supplement-  
12 ed, and probably will be supplemented in writing,  
13 although I think we'd be interested in hearing from any  
14 of the parties whether they think they want an opportuni-  
15 ty after they've examined it to then ask for their  
16 follow-up questions verbally, particularly the expert  
17 witnesses.

18 MR. COPINGA: (Indicating)

19 MS. NIELSON: Mr. Coppinga?

20 MR. COPINGA: I'm stating the fact that --  
21 talking about access to our springs. We've never been  
22 contacted to get to our springs. And as we know right  
23 now, they've only tested our springs twice over the  
24 years.

25 MS. NIELSON: Okay. There's been a few issues  
raised, as Mr. Mitchell just indicated, that I would like

1 to provide some direction on. First of all, relative to  
2 supplementing the record, I would propose and hope that  
3 if there's a concern with this time frame that you've  
4 indicated at this point, that the Division provide ten  
5 days until close of business on the 15th of February to  
6 allow the parties who have presented information this  
7 evening to supplement the record and would ask that they  
8 also provide copies of that information to the other par-  
9 ties. And I'll discuss those with you in just a moment.  
10 But if there is any new information that is provided in  
11 those supplements to the record, that the parties will be  
12 allowed ten additional days to respond to that new infor-  
13 mation in writing. And at any time during this period,  
14 if one or more parties desires to hold a hearing again to  
15 discuss information with witnesses or other parties, we  
16 would consider that.

17 The purposes of being able to supply comments and,  
18 thus, expediting this supplemental response period, for  
19 Castle Valley--Mr. Leamaster, would you serve as contact?

20 MR. LEAMASTER: Yes.

21 MS. NIELSON: North Emery Water Users', Mr.  
22 Menco Copinga?

23 MR. APPEL: Actually, I will do it.

24 MS. NIELSON: You will. Okay. Mrs. Wilson,  
25 does Huntington-Cleveland wish to be in receipt of

1 additional comments with an opportunity to respond?

2 MRS. WILSON: I think so.

3 MS. NIELSON: Okay. Do you want to be contact  
4 on that?

5 MRS. WILSON: No. Make it to Ardeth Wilson.

6 MS. NIELSON: Okay. For Co-Op Mining, Wendell  
7 Owen?

8 MR. OWEN: Maybe to the engineer or to --

9 MS. NIELSON: To Mr. Kingston?

10 MR. KINGSTON: Yes.

11 MS. NIELSON: And Huntington City, Mr.  
12 Johansen?

13 MR. JOHANSEN: That would be fine.

14 MS. NIELSON: So I would ask the parties, if  
15 you don't have addresses or contact of those individuals,  
16 would you please ensure that you get them, and the Divi-  
17 sion would be happy to provide them. Again, the point  
18 being that as you provide that information to the Divi-  
19 sion by the 15th of February, that it would also be  
20 provided to the other parties by that date. And if any  
21 of the parties, being that there is new information --  
22 and I stress new information that they feel they need to  
23 comment on -- that they will notify the Division and will  
24 be allowed ten additional days to respond to that.

25 There was a request raised by Co-Op that there be an

1 opportunity or that we not foreclose the opportunity for  
2 the parties to meet and to work out the problems or the  
3 issues of concern here. And I would like to stress that  
4 that's an opportunity at any point. We're certainly not  
5 in the process of trying to reach some solution in our  
6 action, meaning to foreclose any opportunities for the  
7 parties to do that independently. If that's appropriate,  
8 I would encourage you to do that. The Division would be  
9 happy to assist in any way we can in terms of helping  
10 that sort of meeting to go forward. And to the extent  
11 that there is a feeling by the parties that that sort of  
12 meeting is fruitful and likely to carry into some sort of  
13 agreement that will resolve any of these difficulties, I  
14 would encourage you to let the Division know so that we  
15 could consider that as we move forward on our action.

16 This is an informal hearing, and so those contacts  
17 are certainly appropriate, especially if they can help to  
18 resolve any of the problems. If it is appropriate and  
19 the parties don't object, the Division would like very  
20 much to be a party to those discussions. But we would  
21 leave that to your discretion, at least to the extent  
22 that you would provide us with that information as well.

23 MR. MITCHELL: Let me just address this to  
24 counsel; two things. In the first instance, when you  
25 make your submissions and you provide copies to other

1 partes, would you please -- it will be second nature, I  
2 think to the lawyers, but those of you that do things  
3 that aren't lawyers, would you just put something on the  
4 back and sign to the effect when you mailed it or when  
5 you caused it to get into the hands of somebody else and  
6 how you went about doing that so we have some way of  
7 determining that?

8 With regard to the lawyers, I think it would be very  
9 helpful, when you make your written submissions, when you  
10 finish supplementing your record, I'm sure you have your  
11 own opinions on both sides as to who has what burden of  
12 proof at what point. Mr. Appel made reference to that  
13 when he spoke. I assure you that we would appreciate  
14 having your feedback about that up front. And so any  
15 sort of legal memorandum you would like to file would be  
16 encouraged; and that if you can make reference to what  
17 evidence you believe is presently in the record, which  
18 you believe either meets your burden or where you believe  
19 the burden has not been met, and some sort of analysis of  
20 that from your party.

21 MS. NIELSON: Okay. And the clarification, am  
22 I correct in understanding that Co-Op has a copy of the  
23 January 20th report from Mr. Montgomery?

24 MR. LEAMASTER: I provided them one tonight.

25 MS. NIELSON: You did. Okay. And that was

1 Exhibit 19. And you are in receipt of that?

2 MR. OWEN: Yes.

3 MS. NIELSON: Are there any issues which I've  
4 failed to address that we need to provide for the clari-  
5 fication?

6 MR. GRANT WILSON: (Indicating)

7 MS. NIELSON: Yes, sir. Would you step forward  
8 and identify yourself, please?

9 MR. GRANT WILSON: I am Grant Wilson, repre-  
10 senting Huntington City, but not as a spokesman. Mr. Owen  
11 had reference to a couple of points that I would like to  
12 make sure is on the record. Number one, he mentioned  
13 that there were, in effect, a bond or -- or shares to  
14 cover any loss or damage to the spring. I was party to  
15 that agreement, Mr. Owen, at the time, if you remember  
16 me. I was on the City Council at that time. And one of  
17 the reasons for Huntington City having to go to the  
18 Little Bear Canyon Spring, which he mentioned on the --  
19 upper canyon spring, was the loss of water from the Bear  
20 Canyon Spring at that time when they were mining from  
21 Trail Canyon over into the Bear Canyon area before the  
22 opening of their Bear Canyon Mining program. And, number  
23 three, is that the cause for the large coliform count at  
24 that time, which I was monitoring weekly, and the ice --  
25 three ice programs that you showed there are parts of the

1 boxed-in springs that we had to delete from our water  
2 system at that time when we applied for the loan to get  
3 the water on down the line. So, just for the record.  
4 Thank you.

5 MS. NIELSON: Mr. Wilson, could you clarify the  
6 last statement concerning the sampling of coliform  
7 bacteria? What you're saying is --

8 MR. GRANT WILSON: Excuse me for interrupting  
9 you, ma'am.

10 MS. NIELSON: Surely.

11 MR. GRANT WILSON: I'm saying that I was the  
12 Huntington City Councilman over the water before the  
13 Special Service District came into being.

14 MS. NIELSON: Okay.

15 MR. GRANT WILSON: And it was my responsibility  
16 to collect the water samples that was sent into the State  
17 for approval or rejection. And it was because of those  
18 contaminations of those three springs that was left -- or  
19 surface areas of water that was left as surface water and  
20 had to be deleted from the collection box system, that we  
21 were able to have icicles hanging down the walls on that  
22 side. And also, for information, the break-through from  
23 Hiawatha -- when they broke through in the 1950's and  
24 early 60's, is when the icicles started to show up on the  
25 east side of the canyon. And Mr. Wilson, from both the

1 canal company and the North Emery Water -- remembers that  
2 break-through. He was with them.

3 MR. MITCHELL: Just for clarification, the  
4 period of time in which you were making those collections  
5 was prior to the Special Service District?

6 MR. GRANT WILSON: 1976 to 1978.

7 MR. MITCHELL: Okay. And the springs which you  
8 say have the coliform problem were springs which appeared  
9 on the surface but which were subsequently spread across  
10 the surface, rather than being collected at the Bear  
11 Spring box?

12 MR. GRANT WILSON: They were a group of springs.  
13 And that's what we have at the Bear Canyon collection  
14 system. They're a group of springs that comes out. And  
15 they're all cemented in and put into a pipe that goes out  
16 into one large box and is funneled into the main line  
17 pipe going downstream.

18 MR. MITCHELL: And the three that do not go  
19 into that box come across the surface?

20 MR. GRANT WILSON: Yes.

21 MR. MITCHELL: And the reason they don't is  
22 because of coliform problems?

23 MR. GRANT WILSON: Right.

24 MR. MITCHELL: And then your last point had to  
25 do with the activity of the 1950's in the Hiawatha Mine?

1 MR. GRANT WILSON: This Hiawatha Mine, when  
2 they broke through back in that area.

3 MR. MITCHELL: And the icicles you're referring  
4 to --

5 MR. GRANT WILSON: And it caused a tremendous  
6 drop in the Big Bear Spring -- what we call the Big Bear  
7 Spring. And we had to go on up-canyon at that time and  
8 put in the Little Bear Spring for additional water sup-  
9 plies for Huntington City.

10 MR. MITCHELL: Okay. And the icicles you're  
11 referring to on the east side of the canyon, you're  
12 referring to the east side of Bear Creek Canyon?

13 MR. GRANT WILSON: That Mr. Owen referred to  
14 saying that he had walked Bear Canyon and seen icicles  
15 all up the canyon and didn't see where they had any  
16 reference. I think they had a lot of reference.

17 MR. MITCHELL: And you're saying those first  
18 appeared back in the 1950's?

19 MR. GRANT WILSON: Yes. 50's and -- I've not  
20 walked up there since the 60's. I lost my leg in Korea  
21 at that time.

22 MR. MITCHELL: Thank you. That helps.

23 MS. NIELSON: Are there any other comments or  
24 questions of anyone in the audience that would like to  
25 address at this time? Are there any other issues to come

1 before this informal hearing? Being none, we stand  
2 adjourned. Thank you very much.

3 (Whereupon, this concludes the  
4 reporting of this hearing.)

**CERTIFICATE**

STATE OF UTAH                    )  
  ) ss.  
COUNTY OF CARBON            )

I, John F. Greenig, do hereby certify that I am a  
Registered Professional Reporter and Notary Public in and  
for the State of Utah;

That as such reporter, I attended the hearing of the  
foregoing matter and thereat reported in Stenotype all of  
the testimony and proceedings had and caused said notes  
to be transcribed into typewriting; and the foregoing  
pages numbered 2 to 98 constitute a full, true and cor-  
rect report of the same.

DATED at Price, Utah this 9<sup>th</sup> day of April,  
1991.

  
John F. Greenig, RPR

My Commission Expires:

Jan 18, 1993
